INTERNATIONAL ENERGY AGENCY

The International Energy Agency (IEA) is an autonomous body which was established in November 1974 within the framework of the Organisation for Economic Co-operation and Development (OECD) to implement an international energy programme.

It carries out a comprehensive programme of energy co-operation among twenty-eight of the thirty OECD member countries. The basic aims of the IEA are:

- To maintain and improve systems for coping with oil supply disruptions.
- To promote rational energy policies in a global context through co-operative relations with non-member countries, industry and international organisations.
- To operate a permanent information system on international oil markets.
- To provide data on other aspects of international energy markets.
- To improve the world's energy supply and demand structure by developing alternative energy sources and increasing the efficiency of energy use.
- To promote international collaboration on energy technology.
- To assist in the integration of environmental and energy policies, including relating to climate change.

IEA member countries:

Australia
Austria
Belgium
Canada
Czech Republic
Denmark
Finland
France
Germany
Greece
Hungary
Ireland
Italy
Japan
Korea (Republic of)
Luxembourg
Netherlands
New Zealand
Norway
Poland
Portugal
Slovak Republic
Spain
Sweden
Switzerland
Turkey
United Kingdom
United States

The European Commission also participates in the work of the IEA.

ORGANISATION FOR ECONOMIC CO-OPERATION AND DEVELOPMENT

The OECD is a unique forum where the governments of thirty democracies work together to address the economic, social and environmental challenges of globalisation. The OECD is also at the forefront of efforts to understand and to help governments respond to new developments and concerns, such as corporate governance, the information economy and the challenges of an ageing population. The Organisation provides a setting where governments can compare policy experiences, seek answers to common problems, identify good practice and work to co-ordinate domestic and international policies.

AGENCE INTERNATIONALE DE L'ÉNERGIE

L'Agence Internationale de l'Énergie (AIE) est un organe autonome institué en novembre 1974 dans le cadre de l'Organisation de coopération et de développement économiques (OCDE) afin de mettre en œuvre un programme international de l'énergie.

Elle applique un programme général de coopération dans le domaine de l'énergie entre vingt-huit des trente pays membres de l'OCDE. Les objectifs fondamentaux de l'AIE sont les suivants :

- Tenir à jour et améliorer des systèmes permettant de faire face à des perturbations des approvisionnements pétroliers.
- Œuvrer en faveur de politiques énergétiques rationnelles dans un contexte mondial grâce à des relations de coopération avec les pays non membres, l'industrie et les organisations internationales.
- Gérer un système d'information continue sur le marché international du pétrole.
- Fournir des données sur différents aspects des marchés internationaux de l'énergie.
- Améliorer la structure de l'offre et de la demande mondiales d'énergie en favorisant la mise en valeur de sources d'énergie de substitution et une utilisation plus rationnelle de l'énergie.
- Promouvoir la collaboration internationale dans le domaine de la technologie énergétique.
- Contribuer à l'intégration des politiques d'énergie et d'environnement, notamment en matière de changement climatique.

Pays membres de l'AIE

Allemagne
Australie
Autriche
Belgique
Canada
Danemark
Espagne
États-Unis
Finlande
France
Grèce
Hongrie
Irlande
Italie
Japon
Luxembourg
Norvège
Nouvelle-Zélande
Pays-Bas
Pologne
Portugal
République de Corée
République slovaque
République tchèque
Royaume-Uni
Suède
Suisse
Turquie

La Commission européenne participe également aux travaux de l'AIE.

ORGANISATION DE COOPÉRATION ET DE DÉVELOPPEMENT ÉCONOMIQUES

L'OCDE est un forum unique en son genre où les gouvernements de trente démocraties œuvrent ensemble pour relever les défis économiques, sociaux et environnementaux que pose la mondialisation. L'OCDE est aussi à l'avant-garde des efforts entrepris pour comprendre les évolutions du monde actuel et les préoccupations qu'elles font naître. Elle aide les gouvernements à faire face à des situations nouvelles en examinant des thèmes tels que le gouvernement d'entreprise, l'économie de l'information et les défis posés par le vieillissement de la population. L'Organisation offre aux gouvernements un cadre leur permettant de comparer leurs expériences en matière de politiques, de chercher des réponses à des problèmes communs, d'identifier les bonnes pratiques et de travailler à la coordination des politiques nationales et internationales.

INTRODUCTION

This publication is intended for those involved in analytical and policy work related to international energy issues. It provides detailed statistics on production, trade and consumption for each source of energy in more than 100 non-OECD countries and main regions, including developing countries, Central and Eastern European countries, and the Former Soviet Union. The consistency and complementarity of OECD and non-OECD countries' statistics ensure an accurate picture of the global energy situation.

For the member countries of the Economic Commission for Europe of the United Nations (UN-ECE), the data shown in this publication are mostly based on information provided by the national administrations through annual questionnaires. The five annual questionnaires, common to the OECD, the UN-ECE and the European Union, are: "Oil", "Natural Gas", "Solid Fossil Fuels and Manufactured Gases", "Renewables and Wastes", and "Electricity and Heat".

The commodity balances for all the other countries are based on national energy data of heterogeneous nature, converted and adjusted to fit the IEA format. This volume has been prepared in close collaboration with other international organisations including the Organizacion Latino Americana De Energía (OLADE), the Asia Pacific Energy Research Centre (APERC), the United Nations Statistics Division, the Organisation of Petroleum Exporting Countries (OPEC), and the Forestry Department of the Food and Agriculture Organisation (FAO) of the United Nations. It draws upon and complements the extensive work of the United Nations in the field of world energy statistics.

While every effort is made to ensure the accuracy of the data, quality is not homogeneous throughout the publication. Special methodological issues arise in a number of countries. In some countries data are based on secondary sources and, where incomplete or unavailable, on estimates. In general, data are likely to be more accurate for production, trade and total consumption than for individual sectors in transformation or final consumption.

Commodity balances are presented in two formats depending on the degree of detail available. Moreover, the breakdown by fuel of electricity and heat production in the transformation sector provided in the *Energy Statistics of OECD Countries* is not shown in this publication. General issues of data quality, country notes and individual country data should be consulted when using regional aggregates.

A companion volume – *Energy Balances of Non-OECD Countries (2009 Edition)* – presents corresponding data in comprehensive balances expressed in a common unit, million tonnes of oil equivalent (Mtoe), with 1 toe = 10^7 kcal = 41.868 gigajoules.

Energy data on OECD and non-OECD countries are collected by the team in the Energy Statistics Division (ESD) of the IEA Secretariat, headed by Mr. Jean-Yves Garnier. Non-OECD countries statistics are currently the responsibility of Mr. Frédéric Daniel, Ms. Anne Durand, Mr. Jérôme Garcia, Ms. Heidi Pokki, Mr. Paul Tepes and Mr. Tomasz Truś. Ms. Roberta Quadrelli has overall editorial responsibility. Secretarial support was supplied by Ms. Sharon Burghgraeve. We would like to thank Ms. Sun Fu Jing and Mr. Xie Xin for their precious help, as well as our numerous contacts world-wide in national administrations and in public and private companies for their helpful co-operation.

Complete supply and consumption data from 1971 to 2007 are available on CD-ROM suitable for use on IBM-compatible systems.

In addition, a data service is available on the internet. It includes unlimited access through an annual subscription as well as the possibility to obtain data or a pay-per-view basis. Details are available at http://www.iea.org.

Enquiries about data and methodology, comments and suggestions should be addressed to the head of the non-OECD Countries Section, Energy Statistics Division, at:

Fax: (+33-1) 40-57-66-49
E-mail: wed@iea.org.

WHAT'S NEW

Starting with this edition, international aviation bunkers will no longer be included in the transport sector at the country level. It will be subtracted out of supply in the same way as international marine bunkers. For further details of this change, please see the general notes on methodology in Chapter 2.

INTRODUCTION

Ce recueil s'adresse aux lecteurs qui participent aux travaux d'analyse et d'étude des questions de fond concernant la situation énergétique internationale. Elle fournit, pour chaque source d'énergie, des statistiques détaillées sur la production, les échanges et la consommation dans plus de 100 pays ne faisant pas partie de l'OCDE ainsi que pour plusieurs régions qui comprennent des pays en développement, des pays d'Europe centrale et orientale et l'ex-Union Soviétique. La compatibilité et la complémentarité des statistiques des pays membres de l'OCDE et des pays ne faisant pas partie de l'OCDE garantissent la qualité de l'image de la situation énergétique mondiale.

Les données publiées sur les pays membres de la Commission Economique pour l'Europe des Nations Unies (CEE-ONU) sont basées sur les informations recueillies dans cinq questionnaires annuels communs à l'OCDE, la CEE-ONU et l'Union Européenne : « Pétrole », « Gaz naturel », « Combustibles fossiles solides et gaz manufacturés », « Energies renouvelables et déchets » et « Electricité et chaleur », remplis par les administrations nationales.

Les bilans par produit des autres pays sont basés sur des statistiques énergétiques nationales de nature hétérogène qui ont été converties et harmonisées afin d'être conformes au format de l'AIE. Ce document a été préparé en étroite collaboration avec d'autres organisations internationales dont l'Organización Latino Americana De Energía (OLADE), le Asia Pacific Energy Research Centre (APERC), la Division de Statistiques des Nations Unies, l'Organisation des pays exportateurs de pétrole (OPEP) et le Département des forêts de l'Organisation des Nations Unies pour l'Alimentation et l'Agriculture (FAO). Il utilise et complète le travail considérable déjà accompli par les Nations Unies dans le domaine des statistiques énergétiques.

Bien que tout ait été mis en œuvre pour assurer l'exactitude de ces données, la qualité des chiffres de cette publication n'est pas toujours homogène. Des problèmes méthodologiques particuliers se posent dans un certain nombre de pays. Par ailleurs pour certains pays les données proviennent de sources secondaires et, lorsque les données manquent, elles sont basées sur des estimations. D'une façon générale, les chiffres sont sans doute plus exacts en ce qui concerne la production, les échanges et la consommation totale que pour les secteurs désagrégés de la transformation ou de la consommation finale.

Les bilans par produit sont présentés en deux formats différents selon les détails disponibles. De plus, la ventilation par combustible de la production d'électricité et de chaleur du secteur transformation fournie dans les *Statistiques de l'énergie des pays de l'OCDE* n'est pas présentée dans la présente publication. Il convient, lors de l'utilisation des agrégats régionaux, de consulter également la note générale sur la qualité des données, les notes relatives aux différents pays et les données par pays.

Un recueil complémentaire - *Bilans énergétiques des pays non membres (Edition 2009)* - contient des données équivalentes et exprimées sous la forme de bilans globaux dans une unité commune, à savoir en millions de tonnes d'équivalent pétrole (Mtep), sur la base de 1 tep = 10^7 kcal = 41,868 gigajoules.

Les données énergétiques sur les pays membres et non-membres de l'OCDE sont collectées par la Division des Statistiques Energétiques (ESD) du Secrétariat de l'AIE, dirigée par M. Jean-Yves Garnier. M. Frédéric Daniel, Mlle Anne Durand, M. Jérôme Garcia, Mme Heidi Pokki, M. Paul Tepes et M. Tomasz Truś sont actuellement responsables des statistiques des pays non-membres de l'OCDE. Mme Roberta Quadrelli est responsable de la publication. Mme Sharon Burghgraeve a assuré le secrétariat d'édition et la saisie des textes.

Nous aimerions remercier Mme Sun Fu Jing et M. Xie Xin pour leur aide précieuse, ainsi que les personnes des administrations nationales avec qui nous sommes en contact pour leur coopération fructueuse.

Des données complètes sur l'offre et la demande sont disponibles, pour les années 1971 à 2007, sur CD-ROM exploitables par des systèmes compatibles IBM.

En outre, un service de données est disponible sur internet. Ce service comprend une souscription annuelle pour un accès illimité ou bien la possibilité de payer uniquement pour des données sélectionnées. Pour plus de détails, veuillez consulter http://www.iea.org.

Les demandes de renseignements sur les données ou la méthodologie doivent être adressées au chef de la section des pays non-membres, division des statistiques de l'énergie :

NOUVEAU

Dans cette édition, les soutes aériennes internationales ne sont plus comprises dans le secteur des transports au niveau d'un pays. Elles sont déduites de l'approvisionnement de la même manière que les soutes maritimes internationales. Pour plus de détails sur ce changement, veuillez vous reporter aux notes générales sur la méthodologie au chapitre 2.

PART I: METHODOLOGY

PARTIE I : METHODOLOGIE

1. ISSUES OF DATA QUALITY

Methodology

Considerable effort has been made to ensure that the data presented in this publication adhere to the IEA definitions reported in Part I.2, General notes, and Part I.3, Notes on energy sources. These definitions are used by most of the international organisations that collect energy statistics.

Nevertheless, energy statistics at the national level are often collected using criteria and definitions which differ, sometimes considerably, from those of international organisations. The IEA Secretariat has identified these differences and, where possible, adjusted the data to meet international definitions.

Recognised anomalies occurring in specific countries are presented in Part I.6, Country notes and sources. Country notes present the most important deviations from the IEA methodology, and are by no means a comprehensive list of anomalies by country.

Estimation

In addition to adjustments compensating for differences in definitions, estimations are sometimes required to complete major aggregates, when key statistics are missing.

The Secretariat has aimed to provide all the elements of commodity balances down to the level of final consumption, for all countries and years. Providing all the elements of supply, as well as all inputs and outputs of the main transformation activities (such as oil refining and electricity generation), has often required estimations. Estimations have been generally made after consultation with national statistical offices, oil companies, electricity utilities and national energy experts.

Time series and political changes

Commodity balances for the individual countries of the Former Soviet Union and the Former Yugoslavia start in 1990, and are not available for previous years. These balances are generally based on official submissions, but some estimations have been made by the Secretariat.

Energy statistics for some countries undergo continuous changes in their coverage or methodology. Consequently, "breaks in series" are considered to be unavoidable.

The IEA Secretariat reviews its databases each year. In the light of new assessments, important revisions may be made to time series of individual countries during the course of this review. Therefore, some data in this publication have been substantially revised with respect to previous editions. Please always consult Part I.6, Country notes and sources.

Classification of fuel uses

National statistical sources often lack adequate information on the consumption of fuels in different categories of end use. Many countries do not conduct annual surveys of consumption in the main sectors of economic activity, and published data may be based on out-of-date surveys. Therefore, sectoral disaggregation of consumption should generally be interpreted with caution.

In transition economies (Eastern European countries and countries of the Former Soviet Union) and in China, the sectoral classification of fuel consumption before the reforms of the 1990's significantly differed from that of market economies. Sectoral consumption was defined

according to the economic branch of the user, rather than according to the purpose or use of the fuel. For example, consumption of gasoline in the vehicle fleet of an enterprise attached to the economic branch 'Iron and steel' was classified as consumption in the 'Iron and steel' industry itself.

Where possible, data have been adjusted to fit international classifications. For example, all gasoline is assumed to be consumed in the 'Transport' sector. However, it has not been possible to reclassify products other than gasoline and jet fuel as easily, and few other adjustments have been made to the other products.

Imports and exports

For a given product, imports and exports may not sum up to zero at the world level for a number of reasons. Fuels may be classified differently (i.e. residual fuel oil exports may be reported as refinery feedstocks by the importing country; NGL exports may be reported as LPG by the importing country, etc.). Other possible reasons include discrepancies in conversion factors, inclusion of international marine bunkers in exports, timing differences, data reported on a fiscal year basis instead of calendar year for certain countries, and underreporting of imports and exports for fiscal reasons.

Specific issues by fuel

Oil

The IEA Secretariat collects comprehensive statistics for oil supply and use, including oil for own use of refineries, oil delivered to international bunkers, and oil used as petrochemical feedstock. National statistics often do not report all these amounts.

Reported production of refined products may refer to net rather than gross refinery output; consumption of oil products may be limited to sales to domestic markets, and may not include deliveries to international shipping or aircraft. Oil consumed as petrochemical feedstock in integrated refinery/petrochemical complexes is often not included in available official statistics.

Where possible, the Secretariat has estimated those unreported data, in consultation with the oil industry. In the absence of any other indication, refinery fuel use is estimated to be about 5% of refinery throughput, and equally split between refinery gas and heavy fuel oil. For a description of some adjustments made to the sectoral consumption of oil products, see the above section 'Classification of fuel uses'.

Natural gas

Natural gas should be comprised mainly of methane; other gases, such as ethane and heavier hydrocarbons, should be reported under the heading of 'oil'. The IEA defines natural gas production as the marketable production, i.e. net of field losses, flaring, venting and re-injection.

However, the lack of adequate definitions makes it difficult or impossible to identify all quantities of gas at all different stages of its separation into dry gas (methane) and heavier fractions. National data for natural gas not always explicitly show separate quantities for field losses, flaring, venting and re-injection.

Natural gas supply and demand statistics are normally reported in volumetric units, and it is difficult to obtain accurate data on the calorific value. In the absence of specific information, the IEA generally applies an average gross calorific value of 38 TJ/million m^3.

Reliable consumption data for natural gas at a disaggregated level are often difficult to find. This is especially true for some of the largest natural gas consuming countries in the Middle East. Therefore, industrial use of natural gas for these countries is frequently missing from the data published here.

Electricity

The IEA classification shows 'main activity producers' separately from 'autoproducers' of electricity and heat. As defined in Part I.2, General notes, an autoproducer of electricity is an establishment which, in addition to its main activities, generates electricity wholly or partly for its own use. For non-OECD countries, data on autoproducers are not always known. In such cases, the quantities of fuels used as input to electricity are reported instead under the appropriate end-use sector.

When statistics of production of electricity from combustible renewables and waste are available, they are included in total electricity production. However, these data are not comprehensive; for example, much of the electricity generated from waste biomass in sugar refining facilities remains unreported.

When unreported, inputs of fuels for electricity generation are estimated using information on electricity output, fuel efficiency and type of generation capacity.

Heat

For heat, transition economies (Eastern European countries and countries of the Former Soviet Union) and China used to adopt a different methodology from that adopted in market economies. They allocated the transformation of primary fuels (coal, oil and gas) by industry into heat *for consumption on site* to the transformation activity *'heat production'*, not to industrial consumption, as in the IEA methodology[1]. The transformation output of *Heat* was then allocated to the various end use sectors. The losses occurring in the transformation of fuels into heat in industry were not included in final consumption of industry.

Although a number of countries have recently switched to the practice of international organisations, this important issue reduces the possibility of cross-country comparisons for sectoral end use consumption between transition economies and market economies.

Combustible renewables and waste

The IEA publishes data on production, domestic supply and consumption of combustible renewables and waste for all non-OECD countries and all regions.

Data are often based on secondary sources, and may be of questionable quality, which makes comparisons between countries difficult. For many countries, historical data derive from surveys which were often irregular, irreconcilable, and conducted at a local rather than national level.

Where historical series were incomplete or unavailable, they were estimated using a methodology consistent with the projection framework of the IEA's 1998 edition of *World Energy Outlook* (September 1998). First, nation-wide domestic supply per capita of biomass and wastes was compiled or estimated for 1995. Then, per capita supply for the years 1971 to 1994 was estimated using a log/log equation with either GDP per capita or percentage of urban population as exogenous variable, depending on the region. Finally, supply of total biomass and waste after 1996 was estimated assuming a growth rate either constant, or equal to the population growth, or based on the 1971-1994 trend.

Those estimated time series should be treated very cautiously. The chart below provides a broad indication of the estimation methodology and of the data quality by region.

Region	Main source of data	Data quality	Exogenous variables
Africa	FAO database and AfDB	low	population growth rate
Latin America	national and OLADE	high	none
Asia	surveys	high to low	population growth rate
Non-OECD Europe	questionnaires and FAO	high to medium	none
Former Soviet Union	national, questionnaires and FAO	high to medium	none
Middle East	FAO	medium to low	none

Given the importance of vegetal fuels in the energy picture of many developing countries, balances down to final consumption by end-use for individual products or product categories have been compiled for all countries. The data for the years 2006 and 2007 are shown in the Annual tables. Time series for charcoal production are shown in the Summary tables.

The IEA hopes that the inclusion of these data will encourage national administrations and other agencies active in the field to enhance level and quality of data collection and coverage for biomass data. More details on the methodology used by country may be provided on request, and comments are welcome.

1. For autoproducer plants, the international methodology restricts the inclusion of heat in transformation sector to that sold to third parties. See definition in Part I.2, General notes.

2. GENERAL NOTES

The tables include all "commercial" sources of energy, both primary (hard coal, brown coal/lignite, peat, natural gas, crude oil, NGL, hydro, geothermal/solar, wind, tide/wave/ocean, etc. and nuclear power) and secondary (coal products, manufactured gases, petroleum products, electricity and heat). Data also include various sources of combustible renewables and waste, such as solid biomass, liquid biomass, municipal waste and industrial waste.

Each table is divided into three main parts: the first showing *supply* elements, the second showing the *transformation* and *energy* sectors, and the third showing *final consumption* broken down into the various end-use sectors.

The following description refers to the layout of the full commodity balance type presentation. In the case of the regional and abbreviated tables, the definition of the products is the same. However, sectoral breakdown has been restricted to main totals (Energy sector, etc.) and to selected categories (Iron and steel, etc.).

Supply

The first part of the basic energy balance shows the following elements of supply:

Production
\+ *Inputs from other sources*
\+ *Imports*
\- *Exports*
\- *International marine bunkers*
\- *International aviation bunkers*[1]
± *Stock changes*
= *Domestic supply*

1. Starting with this edition, international aviation bunkers is no longer included in the transport sector at the country level. It is subtracted out of supply in the same way as international marine bunkers.

Production refers to the quantities of fuels extracted or produced, calculated after any operation for removal of inert matter or impurities (e.g. sulphur from natural gas). For inputs of origin other than crude oil and NGL, production should include synthetic crude oil (including mineral oil extracted from bituminous minerals such as shale and tar sands, etc). Production of secondary oil products represents the gross refinery output. Secondary coal products and gases represent the output from coke ovens, gas works, blast furnaces and other transformation processes.

From other sources refers to both primary that has not been accounted for under production and secondary energy that has been accounted for in the production of another fuel. For example, under additives: benzol, alcohol and methanol produced from natural gas; under refinery feedstocks: backflows from the petrochemical industry used as refinery feedstocks; under "other hydrocarbons" (included with crude oil) ; liquids obtained from coal liquefaction and GTL plants, under primary coal: recovered slurries, middlings, recuperated coal dust and other low-grade coal products that cannot be classified according to type of coal from which they are obtained; under gas works gas: natural gas, refinery gas, and LPG, that are treated or mixed in gas works (i.e. gas works gas produced from sources other than coal).

Imports *and* ***exports*** comprise amounts having crossed the national territorial boundaries of the country whether or not customs clearance has taken place.

For coal: Imports and exports comprise the amount of fuels obtained from or supplied to other countries, whether or not there is an economic or customs union between the relevant countries. Coal in transit should not be included.

For oil and gas: Quantities of crude oil and oil products imported or exported under processing agreements (i.e. refining on account) are included. Quantities of

oil in transit are excluded. Crude oil, NGL and natural gas are reported as coming from the country of origin; refinery feedstocks and oil products are reported as coming from the country of last consignment. Re-exports of oil imported for processing within bonded areas are shown as an export of product from the processing country to the final destination.

For electricity: Amounts are considered as imported or exported when they have crossed the national territorial boundaries of the country. If electricity is "wheeled" or transited through a country, the amount is shown as both an import and an export.

International marine bunkers covers those quantities delivered to ships of all flags that are engaged in international navigation. The international navigation may take place at sea, on inland lakes and waterways, and in coastal waters. Consumption by ships engaged in domestic navigation is excluded. The domestics/international split is determined on the basis of port of departure and port of arrival, and not by the flag or nationality of the ship. Consumption by fishing vessels and by military forces is also excluded. See definitions of *transport, fishing, and non-specified "other sectors"*.

International aviation bunkers includes deliveries of aviation fuels to aircraft for international aviation. Fuels used by airlines for their road vehicles are excluded. The domestic/international split should be determined on the basis of departure and landing locations and not by the nationality of the airline. For many countries this incorrectly excludes fuel used by domestically owned carriers for their international departures.

Note: In October 2008 the IEA hosted the 3rd meeting of InterEnerStat. This group is made up of 24 international organizations that collect or use energy statistics. One of the objectives of the group is to improve the quality of energy data by harmonizing definitions for energy sources and flows. As a result of this meeting, the IEA has decided to align its energy statistics and balances with most other international organizations and to treat international aviation bunkers in the same way as international marine bunkers. Starting with this edition, international aviation bunkers will no longer be included in the transport sector at the country level. It will be subtracted out of supply in the same way as international marine bunkers.

Stock changes reflects the difference between opening stock levels on the first day of the year and closing levels on the last day of the year of stocks on national territory held by producers, importers, energy transformation industries and large consumers. Oil and gas stock changes in pipelines are not taken into account. With the exception of large users mentioned above, changes in final users' stocks are not taken into account. A stock build is shown as a negative number, and a stock draw as a positive number.

Domestic supply is defined as *production + from other sources + imports - exports - international marine bunkers - international aviation bunkers ± stock changes*.

Transfers comprises *interproduct transfers, products transferred* and *recycled products*.

Interproduct transfers result from reclassification of products either because their specification has changed or because they are blended into another product, e.g. kerosene may be reclassified as gasoil after blending with the latter in order to meet its winter diesel specification. The net balance of *interproduct transfers* is zero.

Products transferred is intended for petroleum products imported for further processing in refineries. For example, fuel oil imported for upgrading in a refinery is transferred to the feedstocks category.

Recycled products are finished products which pass a second time through the marketing network, **after** having been once delivered to final consumers (e.g. used lubricants which are reprocessed).

Statistical difference is defined as deliveries to *final consumption* + use for *transformation* and *consumption* within the *energy sector* + *distribution losses* – *domestic supply* – *transfers*. Statistical differences arise because the data for the individual components of supply are often derived from different data sources by the national administration. Furthermore, the inclusion of changes in some large consumers' stocks in the supply part of the balance introduces distortions which also contribute to the statistical differences.

Transformation sector

The *transformation sector* comprises the conversion of primary forms of energy to secondary and further transformation (e.g. coking coal to coke, crude oil to petroleum products, heavy fuel oil to electricity).

Electricity plants refers to plants which are designed to produce electricity only. If one or more units of the plant is a CHP unit (and the inputs and outputs can not be distinguished on a unit basis) then the whole plant

is designated as a CHP plant. Both main activity producers (formerly known as public)[2] and autoproducer[3] plants are included here.

Combined heat and power plants refers to plants which are designed to produce both heat and electricity (sometimes referred to as co-generation power stations). If possible, fuel inputs and electricity/heat outputs are on a unit basis rather than on a plant basis. However, if data are not available on a unit basis, the convention for defining a CHP plant noted above should be adopted. Both main activity producers (formerly known as public) and autoproducer plants are included here. *Note that for autoproducer CHP plants, all fuel inputs to electricity production are taken into account, while only the part of fuel inputs to heat sold is shown. Fuel inputs for the production of heat consumed within the autoproducer's establishment are not included here but are included with figures for the final consumption of fuels in the appropriate consuming sector.*

Heat plants refers to plants (including heat pumps and electric boilers) designed to produce heat only and who sell heat to a third party (e.g. residential, commercial or industrial consumers) under the provisions of a contract). Both main activity producers (formerly known as public) and autoproducer plants are included here. Heat pumps that are operated within the residential sector where the heat is not sold are not considered a transformation process and are not included here – the electricity consumption would appear as residential use.

Blast furnaces/gas works covers the quantities of fuels used for the production of town gas, blast furnace gas and oxygen steel furnace gas. The production of pig-iron from iron ore in blast furnaces uses fuels for supporting the blast furnace charge and providing heat and carbon for the reduction of the iron ore. Accounting for the calorific content of the fuels entering the process is a complex matter as transformation (into blast furnace gas) and consumption (heat of combustion) occur simultaneously. Some carbon is also retained in the pig-iron; almost all of this reappears later in the oxygen steel furnace gas (or converter gas) when the pig-iron is converted to steel. In principle, the quantities of all fuels (e.g. pulverised coal injection (PCI) coal, coke oven coke, natural gas and oil) entering blast furnaces and the quantity of blast furnace gas and oxygen steel furnace gas produced are collected. However, except for coke oven coke inputs, the data are often uncertain or incomplete. The Secretariat then needs to split these inputs into the transformation and consumption components. The transformation component is shown in the row *blast furnaces/gas works* in the column appropriate for the fuel, and the consumption component is shown in the row *iron and steel* in final consumption in the column appropriate for the fuel. Starting with the 1998 edition, the Secretariat decided to assume a transformation efficiency such that the carbon input into the blast furnaces should equal the carbon output. This is roughly equivalent to assuming an energy transformation efficiency of 40%. , based on the results of the model developed for OECD countries.[4] It provides a more consistent balancing of the carbon input into and output from the blast furnaces when the IEA data are used to calculate CO_2 emissions from fuel combustion using the Intergovernmental Panel on Climate Change (IPCC) methodology as published in the *Revised 1996 IPCC Guidelines for National Greenhouse Gas Inventories.*[5]

Coke/patent fuel/BKB plants covers the use of fuels for the manufacture of coke, coke oven gas, patent fuels and BKB.

Petroleum refineries covers the use of hydrocarbons for the manufacture of finished petroleum products.

Petrochemical industry covers backflows returned from the petrochemical sector. Note, backflows from oil products that are used for non-energy purposes (i.e. white spirit and lubricants) are not included here, but in non-energy use.

Liquefaction plants includes diverse liquefaction processes, such as coal liquefaction plants and gas-to-liquids-plants.

Other transformation sector includes the transformation of solid biomass into charcoal and other non-specified transformation.

2. Main activity producers (formerly referred to as supply undertakings) generate electricity and/or heat for sale to third parties, *as their primary activity*. They may be privately or publicly owned. Note that the sale need not take place through the public grid.

3. Autoproducer undertakings generate electricity and/or heat, wholly or partly for their own use as an activity which supports their primary activity. They may be privately or publicly owned.

4. Please refer to *Energy Statistics of OECD Countries* for more information on the blast furnace model used for the OECD countries.

5. The *Revised 1996 IPCC Guidelines for National Greenhouse Gas Inventories* are available from the IPCC National Greenhouse Gas Inventories Programme at http://www.ipcc-nggip.iges.or.jp.

Energy sector

The energy sector covers the amount of fuels used by the energy producing industries (e.g. for heating, lighting and operation of all equipment used in the extraction process, for traction and distribution).

Energy producing industries' own use includes energy consumed by transformation industries for heating, pumping, traction and lighting purposes [ISIC[6] Divisions 10, 11, 12, 23 and 40].

Fuel mining and extraction includes both coal mining and oil and gas extraction. For hard coal and lignite mining, this represents the energy which is used directly within the coal industry. It excludes coal burned in pithead power stations (included under electricity plants in the transformation sector) and free allocations to miners and their families (considered as part of household consumption and therefore included under residential). For oil and gas extraction, flared gas is not included.

Petroleum refineries.

Electricity, CHP and heat plants.

Pumped storage (electricity consumed in hydroelectric plants).

Other energy sector (including own consumption in patent fuel plants, coke ovens, gas works, blast furnaces, BKB and lignite coke plants, coal liquefaction plants, gas-to-liquids plants, charcoal production plants, nuclear plants as well as use in non-specified energy sector).

Distribution losses

Distribution losses includes losses in gas distribution, electricity transmission, and coal transport.

Final consumption

The term ***final consumption*** (equal to the sum of the consumption in the end-use sectors) implies that energy used for transformation and for own use of the energy producing industries is excluded. Final consumption reflects for the most part deliveries to consumers (see note on *stock changes*).

Backflows from the petrochemical industry are not included in final consumption (see *from other sources* under supply and *petrochemical industry* in the transformation sector).

Starting with this edition, international aviation bunkers is no longer included in final consumption at the country level. For details see the note for Supply.

Industry sector

Consumption of the industry sector is specified in the following sub-sectors (energy used for transport by industry is not included here but is reported under transport):

Iron and steel industry [ISIC Group 271 and Class 2731];

Chemical and petrochemical industry [ISIC Division 24] excluding petrochemical feedstocks.

Non-ferrous metals basic industries [ISIC Group 272 and Class 2732];

Non-metallic minerals such as glass, ceramic, cement, etc. [ISIC Division 26];

Transport equipment [ISIC Divisions 34 and 35];

Machinery. Fabricated metal products, machinery and equipment other than transport equipment [ISIC Divisions 28, 29, 30, 31 and 32];

Mining (excluding fuels) and quarrying [ISIC Divisions 13 and 14];

Food and tobacco [ISIC Divisions 15 and 16];

Paper, pulp and print [ISIC Divisions 21 and 22];

Wood and wood products (other than pulp and paper) [ISIC Division 20];

Construction [ISIC Division 45];

Textile and leather [ISIC Divisions 17, 18 and 19];

Non-specified [7] (any manufacturing industry not included above) [ISIC Divisions 25, 33, 36 and 37].

Note: Most countries have difficulties supplying an industrial breakdown for all fuels. In these cases, the *non-specified* industry row has been used. Regional aggregates of industrial consumption should therefore be used with caution.

6. International Standard Industrial Classification of All Economic Activities, Series M, No. 4/Rev. 3, United Nations, New York, 1990.

Transport sector

Consumption in the transport sector covers all transport activity (in mobile engines) regardless of the economic sector to which it is contributing [ISIC Divisions 60, 61 and 62], and is divided into the following sub-sectors:

Domestic aviation includes deliveries of aviation fuels to aircraft for domestic aviation - commercial, private, agricultural, etc. It includes use for purposes other than flying, e.g. bench testing of engines, but not airline use of fuel for road transport. The domestic/international split should be determined on the basis of departure and landing locations and not by the nationality of the airline. Note that this may include journeys of considerable length between two airports in a country (e.g. San Francisco to Honolulu). For many countries this incorrectly includes fuel used by domestically owned carriers for outbound international traffic (see *international aviation bunkers*);

Road includes fuels used in road vehicles as well as agricultural and industrial highway use. Excludes military consumption as well as motor gasoline used in stationary engines and diesel oil for use in tractors that are not for highway use;

Rail includes quantities used in rail traffic, including industrial railways;

Pipeline transport includes energy used in the support and operation of pipelines transporting gases, liquids, slurries and other commodities, including the energy used for pump stations and maintenance of the pipeline. Energy for the pipeline distribution of natural or manufactured gas, hot water or steam (ISIC Division 40) from the distributor to final users is excluded and should be reported in the *energy sector*, while the energy used for the final distribution of water (ISIC Division 41) to household, industrial, commercial and other users should be included in *commercial/public services*. Losses occurring during the transport between distributor and final users should be reported as *distribution losses*;

Domestic navigation includes fuels delivered to vessels of all flags not engaged in international navigation (see *international marine bunkers*). The domestic/international split should be determined on the basis of port of departure and port of arrival and not by the flag or nationality of the ship. Note that this may include journeys of considerable length between two ports in a country (e.g. San Francisco to Honolulu). Fuel used for ocean, coastal and inland fishing and military consumption are excluded;

Non-specified [7] includes all transport not elsewhere specified.

Note: *International marine bunkers* and *International aviation bunkers* are shown in *Supply* and are not included in the transport sector except for the world total. Moreover, information about military consumption is not available for most of non-OECD countries.

Other sectors

Residential includes consumption by households, excluding fuels used for transport. Includes households with employed persons [ISIC Division 95] which is a small part of total residential consumption;

Commercial and public services [ISIC Divisions 41, 50-52, 55, 63-67, 70-75, 80, 85, 90-93 and 99];

Agriculture/forestry includes deliveries to users classified as agriculture, hunting and forestry by the ISIC, and therefore includes energy consumed by such users whether for traction (excluding agricultural highway use), power or heating (agricultural and domestic) [ISIC Divisions 01 and 02];

Fishing includes fuels used for inland, coastal and deep-sea fishing. Fishing covers fuels delivered to ships of all flags that have refuelled in the country (including international fishing) as well as energy used in the fishing industry [ISIC Division 05]. Prior to the 2007 edition, *fishing was included with agriculture/forestry and this may continue to be the case for some countries*;

Non-specified [7] includes all fuel use not elsewhere specified as well as consumption in the above-designated categories for which separate figures have not been provided. Military fuel use for all mobile and stationary consumption is included here (e.g. ships, aircraft, road and energy used in living quarters) regardless of whether the fuel delivered is for the military of that country or for the military of another country.

Non-energy use

Non-energy use covers those fuels that are used as raw materials in the different sectors and are not consumed as a fuel or transformed into another fuel. Non-energy use is shown separately in final consumption under the heading non-energy use.

7. In the short country tables, non-specified is shown together with other categories not explicitly listed (Other/non-specified).

The energy/non-energy split for the petroleum products is determined based on information submitted by each country.

of which: petrochemical feedstocks. The petrochemical industry includes cracking and reforming processes for the purpose of producing ethylene, propylene, butylene, synthesis gas, aromatics, butadene and other hydrocarbon-based raw materials in processes such as steam cracking, aromatics plants and steam reforming [part of ISIC Group 241].

3. NOTES ON ENERGY SOURCES

Coal/peat

The fuels in this section are expressed in thousand tonnes.

Coking coal

Coking coal refers to coal with a quality that allows the production of a coke suitable to support a blast furnace charge. Its gross calorific value is greater than 23 865 kJ/kg (5 700 kcal/kg) on an ash-free but moist basis.

Other bituminous coal and anthracite

Other bituminous coal is used for steam raising and space heating purposes and includes all bituminous coal that is not included under coking coal. It is usually more than 10% volatile matter and a relatively high carbon content (less than 90% fixed carbon). Its gross calorific value is greater than 23 865 kJ/kg (5 700 kcal/kg), but usually lower than that of coking coal.

Anthracite is a high rank coal used for industrial and residential applications. It is generally less than 10% volatile matter and a high carbon content (about 90% fixed carbon). Its gross calorific value is greater than 23 865 kJ/kg (5 700 kcal/kg) on an ash-free but moist basis.

Sub-bituminous coal

Non-agglomerating coals with a gross calorific value between 17 435 kJ/kg (4 165 kcal/kg) and 23 865 kJ/kg (5 700 kcal/kg) containing more than 31% volatile matter on a dry mineral matter free basis.

Lignite and brown coal

Lignite/brown coal is a non-agglomerating coal with a gross calorific value of less than 17 435 kJ/kg (4 165 kcal/kg), and greater than 31% volatile matter on a dry mineral matter free basis.

Oil shale and tar sands produced and combusted directly are included in this category. Oil shale and tar sands used as inputs for other transformation processes are also included here (this includes the portion consumed in the transformation process). Shale oil and other products derived from liquefaction are included in *from other sources* under crude oil (*other hydrocarbons*).

Peat

Peat is a combustible soft, porous or compressed, fossil sedimentary deposit of plant origin with high water content (up to 90% in the raw state), easily cut, of light to dark brown colour.

Coke oven coke, gas coke and coal tar

Coke oven coke is the solid product obtained from the carbonisation of coal, principally coking coal, at high temperature. It is low in moisture content and volatile matter. Coke oven coke is used mainly in the iron and steel industry, acting as energy source and chemical agent. Also included are semi-coke (a solid product obtained from the carbonisation of coal at a low temperature), lignite coke (a semi-coke made from lignite/brown coal), coke breeze and foundry coke. The heading other energy sector includes the consumption at the coking plants themselves. Consumption in the iron and steel industry does not include coke converted into blast furnace gas. To obtain the total consumption of coke oven coke in the iron and steel industry, the quantities converted into blast furnace gas have to be added (these are included in blast furnaces/gas works).

Gas coke is a by-product of hard coal used for the production of town gas in gas works. Gas coke is used for heating purposes. Other energy sector includes the consumption of gas coke at gas works.

Coal tar is a result of the destructive distillation of bituminous coal. Coal tar is the liquid by-product of the distillation of coal to make coke in the coke oven process. Coal tar can be further distilled into different organic products (e.g. benzene, toluene, naphthalene), which normally would be reported as a feedstock to the petrochemical industry.

Patent fuel and brown coal / peat briquettes (BKB)

Patent fuel is a composition fuel manufactured from hard coal mines with the addition of a binding agent. The amount of patent fuel produced is, therefore, slightly higher than the actual amount of coal consumed in the transformation process. Consumption of patent fuels during the patent fuel manufacturing process is shown under *other energy sector*.

BKB are composition fuels manufactured from lignite/brown coal, produced by briquetting under high pressure. These figures include peat briquettes, dried lignite fines and dust. The heading *other energy sector* includes consumption by briquetting plants.

Crude oil, NGL, refinery feedstocks

The fuels in this section are expressed in thousand tonnes.

Crude oil

Crude oil is a mineral oil consisting of a mixture of hydrocarbons of natural origin and associated impurities, such as sulphur. It exists in the liquid phase under normal surface temperatures and pressure and its physical characteristics (density, viscosity, etc.) are highly variable. It includes field or lease condensates (separator liquids) which are recovered from associated and non-associated gas where it is commingled with the commercial crude oil stream.

Other hydrocarbons, including emulsified oils (e.g. orimulsion), synthetic crude oil, mineral oils extracted from bituminous minerals such as oil shale, bituminous sand, etc. and liquids from coal liquefaction, are included here.

Natural gas liquids (NGL)

NGLs are the liquid or liquefied hydrocarbons produced in the manufacture, purification and stabilisation of natural gas. These are those portions of natural gas which are recovered as liquids in separators, field facilities, or gas processing plants. NGLs include but are not limited to ethane, propane, butane, pentane, natural gasoline and condensate.

Refinery feedstocks

A refinery feedstock is a processed oil destined for further processing (e.g. straight run fuel oil or vacuum gas oil) other than blending in the refining industry. It is transformed into one or more components and/or finished products. This definition covers those finished products imported for refinery intake and those returned from the petrochemical industry to the refining industry.

Additives

Additives are non-hydrocarbon substances added to or blended with a product to modify its properties, for example, to improve its combustion characteristics. Alcohols and ethers (MTBE, methyl tertiary-butyl ether) and chemical alloys such as tetraethyl lead are included here. The biomass fractions of biogasoline, biodiesel and ethanol are not included here, but under liquid biomass. This differs from the presentation of additives in the *Oil Information* publication.

Petroleum products

The fuels in this section are expressed in thousand tonnes.

Petroleum products are any oil-based products which can be obtained by distillation and are normally used outside the refining industry. The exceptions to this are those finished products which are classified as refinery feedstocks.

Production of petroleum products shows gross refinery output for each product.

Refinery fuel (row *petroleum refineries*, under *energy sector*) represents consumption of petroleum products, both intermediate and finished, within refineries, e.g. for heating, lighting, traction, etc.

Refinery gas (not liquefied)

Refinery gas is defined as non-condensable gas obtained during distillation of crude oil or treatment of oil products (e.g. cracking) in refineries. It consists mainly of hydrogen, methane, ethane and olefins. It also includes gases which are returned from the petrochemical industry. Refinery gas production refers to

gross production. Own consumption is shown separately under *petroleum refineries* in the *energy* sector.

Liquefied petroleum gases (LPG) and ethane

Liquefied petroleum gases are the light hydrocarbon fraction of the paraffin series, derived from refinery processes, crude oil stabilisation plants and natural gas processing plants, comprising propane (C_3H_8) and butane (C_4H_{10}) or a combination of the two. They could also include propylene, butylene, isobutene and isobutylene. LPG are normally liquefied under pressure for transportation and storage.

Ethane is a naturally gaseous straight-chain hydrocarbon (C_2H_6). It is a colourless paraffinic gas which is extracted from natural gas and refinery gas streams.

Motor gasoline

Motor gasoline is light hydrocarbon oil for use in internal combustion engines such as motor vehicles, excluding aircraft. Motor gasoline is distilled between 35°C and 215°C and is used as a fuel for land based spark ignition engines. Motor gasoline may include additives, oxygenates and octane enhancers, including lead compounds such as TEL (tetraethyl lead) and TML (tetramethyl lead). Motor gasoline does not include the liquid biofuel or ethanol blended with gasoline - see liquid biomass. This differs from the presentation of motor gasoline in the *Oil Information* publication.

Aviation fuel

Aviation fuel comprises gasoline and kerosene type jet fuels meeting specifications for use in aviation turbine power units as well as small amounts of aviation gasoline.

Gasoline type jet fuel includes all light hydrocarbon oils for use in aviation turbine power units, which distil between 100°C and 250°C. This fuel is obtained by blending kerosenes and gasoline or naphthas in such a way that the aromatic content does not exceed 25% in volume, and the vapour pressure is between 13.7 kPa and 20.6 kPa. Additives can be included to improve fuel stability and combustibility.

Kerosene type jet fuel is a medium distillate used for aviation turbine power units. It has the same distillation characteristics and flash point as kerosene (between 150°C and 300°C but not generally above 250°C). In addition, it has particular specifications (such as freezing point) which are established by the International Air Transport Association (IATA). It includes kerosene blending components.

Aviation gasoline is motor spirit prepared especially for aviation piston engines, with an octane number suited to the engine, a freezing point of -60°C, and a distillation range usually within the limits of 30°C and 180°C.

Kerosene

Kerosene (other than kerosene used for aircraft transport which is included with aviation fuels) comprises refined petroleum distillate intermediate in volatility between gasoline and gas/diesel oil. It is a medium oil distilling between 150°C and 300°C.

Gas/diesel oil (distillate fuel oil)

Gas/diesel oil includes heavy gas oils. Gas oils are obtained from the lowest fraction from atmospheric distillation of crude oil, while heavy gas oils are obtained by vacuum redistillation of the residual from atmospheric distillation. Gas/diesel oil distils between 180°C and 380°C. Several grades are available depending on uses: diesel oil for diesel compression ignition (cars, trucks, marine, etc.), light heating oil for industrial and commercial uses, and other gas oil including heavy gas oils which distil between 380°C and 540°C and which are used as petrochemical feedstocks. Gas/diesel oil does not include the liquid biofuel blended with gas/diesel oil – see liquid biomass. This differs from the presentation of gas/diesel oil in the *Oil Information* publication.

Heavy fuel oil (residual)

Heavy fuel oil defines oils that make up the distillation residue. It comprises all residual fuel oils, including those obtained by blending. Its kinematic viscosity is above 10 cSt at 80°C. The flash point is always above 50°C and the density is always higher than 0.90 kg/l.

Naphtha

Naphtha is a feedstock destined either for the petrochemical industry (e.g. ethylene manufacture or aromatics production) or for gasoline production by reforming or isomerisation within the refinery. Naphtha comprises material that distils between 30°C and 210°C. Naphtha imported for blending is shown as an import of naphtha, and then shown in the transfers row as a negative entry for naphtha and a positive entry for the corresponding finished product (e.g. gasoline).

Petroleum coke

Petroleum coke is defined as a black solid residue, obtained mainly by cracking and carbonising of petroleum derived feedstocks, vacuum bottoms, tar and pitches in processes such as delayed coking or fluid coking. It consists mainly of carbon (90 to 95%) and has a low ash content. It is used as a feedstock in coke ovens for the steel industry, for heating purposes, for electrode manufacture and for production of chemicals. The two most important qualities are "green coke" and "calcinated coke". This category also includes "catalyst coke" deposited on the catalyst during refining processes: this coke is not recoverable and is usually burned as refinery fuel.

Other petroleum products

The category *other petroleum products* groups together white spirit and SBP, lubricants, bitumen, paraffin waxes and others.

White spirit and SBP are refined distillate intermediates with a distillation in the naphtha/kerosene range. White Spirit has a flash point above 30°C and a distillation range of 135°C to 200°C. Industrial spirit (SBP) comprises light oils distilling between 30°C and 200°C, with a temperature difference between 5% volume and 90% volume distillation points, including losses, of not more than 60°C. In other words, SBP is a light oil of narrower cut than motor spirit. There are seven or eight grades of industrial spirit, depending on the position of the cut in the distillation range defined above.

Lubricants are hydrocarbons produced from distillate or residue; they are mainly used to reduce friction between bearing surfaces. This category includes all finished grades of lubricating oil, from spindle oil to cylinder oil, and those used in greases, including motor oils and all grades of lubricating oil base stocks.

Bitumen is a solid, semi-solid or viscous hydrocarbon with a colloidal structure that is brown to black in colour. It is obtained by vacuum distillation of oil residues from atmospheric distillation of crude oil. Bitumen is often referred to as asphalt and is primarily used for surfacing of roads and for roofing material. This category includes fluidised and cut back bitumen.

Paraffin waxes are saturated aliphatic hydrocarbons. These waxes are residues extracted when dewaxing lubricant oils, and they have a crystalline structure which is more or less fine according to the grade. Their main characteristics are that they are colourless, odourless and translucent, with a melting point above 45°C.

Other petroleum products not classified above (e.g. tar, sulphur and grease) are included here. This category also includes aromatics (e.g. BTX or benzene, toluene and xylene) and olefins (e.g. propylene) produced within refineries.

Gases

The gases in this section are expressed in terajoules on a **gross calorific value** basis.

Natural gas

Natural gas comprises gases, occurring in underground deposits, whether liquefied or gaseous, consisting mainly of methane. It includes both "non-associated" gas originating from fields producing only hydrocarbons in gaseous form, and "associated" gas produced in association with crude oil as well as methane recovered from coal mines (colliery gas) or from coal seams (coal seam gas).

Production represents dry marketable production within national boundaries, including offshore production and is measured after purification and extraction of NGL and sulphur. It includes gas consumed by gas processing plants and gas transported by pipeline. Quantities of gas that are re-injected, vented or flared are excluded.

Gas works gas

Gas works gas covers all types of gas produced in public utility or private plants, whose main purpose is the manufacture, transport and distribution of gas. It includes gas produced by carbonisation (including gas produced by coke ovens and transferred to gas works), by total gasification (with or without enrichment with oil products) and by reforming and simple mixing of gases and/or air.

Coke oven gas

Coke oven gas is obtained as a by-product of the manufacture of coke oven coke for the production of iron and steel.

Blast furnace gas

Blast furnace gas is produced during the combustion of coke in blast furnaces in the iron and steel industry. It is recovered and used as a fuel, partly within the plant and partly in other steel industry processes or in power stations equipped to burn it.

Oxygen steel furnace gas is obtained as a by-product of the production of steel in an oxygen furnace and is recovered on leaving the furnace. Oxygen steel furnace gas is also known as converter gas, LD gas or BOS gas.

Combustible renewables and waste

The fuels in this section are expressed in terajoules on a **net calorific value** basis, with the exception of liquid biomass which is in thousand tonnes.

Solid biomass

Solid biomass is defined as any plant matter used directly as fuel or converted into other forms before combustion. This covers a multitude of woody materials generated by industrial process or provided directly by forestry and agriculture (firewood, wood chips, bark, sawdust, shavings, chips, sulphite lyes *also known as black liquor*, animal materials/wastes and other solid biomass).

Charcoal produced from solid biomass is also included here. Since charcoal is a secondary product, its treatment is slightly different than that of the other primary biomass. Production of charcoal (an output in the transformation process) is offset by the inputs of primary biomass into the charcoal production process. The losses from this process are included in the row *other transformation sector*. Other supply (e.g. trade and stock changes) as well as consumption are aggregated directly with the primary biomass. In most countries, only the primary biomass is reported.

Biogas

Biogas is derived principally from the anaerobic fermentation of biomass and solid wastes and combusted to produce heat and/or power. Included in this category are landfill gas, sludge gas and other biogas such as biogas produced from the anaerobic fermentation of animal slurries and of wastes in abattoirs, breweries and other agro-food industries.

Liquid biomass

Liquid biomass includes the liquid biofuel that is blended into gasoline and gas/diesel oil and other liquid biofuels. It does not include the total volume of gasoline or diesels into which the biofuels are blended.

Biogasoline includes bioethanol (ethanol produced from biomass and/or the biodegradable fraction of waste), biomethanol (methanol produced from biomass and/or the biodegradable fraction of waste), bioETBE (ethyl-tertio-butyl-ether produced on the basis of bioethanol; the percentage by volume of bioETBE that is calculated as biofuel is 47%) and bioMTBE (methyl-tertio-butyl-ether produced on the basis of biomethanol: the percentage by volume of bioMTBE that is calculated as biofuel is 36%).

Biodiesels includes biodiesel (a methyl-ester produced from vegetable or animal oil, of diesel quality), biodimethylether (dimethylether produced from biomass), Fischer Tropsh (Fischer Tropsh produced from biomass), cold pressed bio-oil (oil produced from oil seed through mechanical processing only) and all other liquid biofuels which are added to, blended with or used straight as transport diesel.

Other liquid biofuels includes liquid biofuels not reported in either biogasoline or biodiesels.

Waste and other non-specified

Municipal waste consists of products that are combusted directly to produce heat and/or power and comprises wastes produced by households, industry, hospitals and the tertiary sector that are collected by local authorities for incineration at specific installations.

Industrial waste of non-renewable origin consists of solid and liquid products (e.g. tyres) combusted directly, usually in specialised plants, to produce heat and/or power. Renewable industrial waste is not included here, but with solid biomass, biogas or liquid biomass.

Electricity and heat

Electricity is expressed in gigawatt hours and heat is expressed in terajoules.

Electricity

Gross electricity production is measured at the terminals of all alternator sets in a station; it therefore includes the energy taken by station auxiliaries and losses in transformers that are considered integral parts of the station.

The difference between gross and net production is generally estimated as 7% for conventional thermal stations, 1% for hydro stations, and 6% for nuclear, geothermal and solar stations. Production in hydro stations includes production from pumped storage plants.

Heat

Heat production includes all heat produced by main activity producer CHP and heat plants, as well as heat sold by autoproducer CHP and heat plants to third parties.

Fuels used to produce quantities of heat for sale are included in the transformation sector under the rows *CHP plants* and *Heat plants*. The use of fuels for heat which is not sold is included under the sectors in which the fuel use occurs.

Hydro power

Hydro power represents the potential and kinetic energy of water converted into electricity in hydroelectric plants.

Geothermal energy

Geothermal energy is the energy available as heat emitted from within the earth's crust, usually in the form of hot water or steam. It is exploited at suitable sites:

- for electricity generation using dry stream or high enthalpy brine after flashing
- directly as heat for district heating, agriculture, etc.

Solar energy

Solar energy is the solar radiation exploited for hot water production and electricity generation, by:

- flat plate collectors, mainly of the thermosyphon type, for domestic hot water or for the seasonal heating of swimming pools
- photovoltaic cells
- solar thermal-electric plants

Passive solar energy for the direct heating, cooling and lighting of dwellings or other buildings is not included.

Tide/wave/ocean energy

Tide, wave and ocean represents the mechanical energy derived from tidal movement, wave motion or ocean current and exploited for electricity generation.

Wind energy

Wind energy represents the kinetic energy of wind exploited for electricity generation in wind turbines.

4. NOTES ON SUMMARY TABLES

Production of charcoal

Charcoal is a secondary biomass product and refers to the solid residue, consisting mainly of carbon, derived from the distillation of wood or other biomass products in the absence of air. Please note that in the Annual tables, charcoal is included under Solid biomass. See also Part I.3, Notes on energy sources.

Consumption of electricity

Covers electricity used in transformation, energy sector and final consumption, but excludes distribution losses.

Oil demand by main product groups

In this publication, oil demand is defined as the sum of domestic supply, transfers and statistical differences less inputs to refinery, petrochemical industry and liquefaction in the transformation sector, and refineries' own use in the energy sector.

Motor gasoline includes additives, biogasoline, biodiesels and other liquid biofuels.

Other covers crude oil, other hydrocarbons, refinery gas, petroleum coke, white spirit and SBP, lubricants bitumen, paraffin waxes and others such as tar, sulphur, grease, as well as aromatics (e.g. BTX or benzene, toluene and xylene) and olefins (e.g. propylene) produced within refineries.

Refinery fuel shows petroleum refineries' own use of petroleum fuels for operation of equipment, heating and lighting. It mainly includes refinery gas, gas/diesel oil and heavy fuel oil.

International marine bunkers shows international marine bunkers consumption of liquid fuels, mainly gas/diesel oil and heavy fuel oil. Please note that only in the tables of oil demand by main product groups *International aviation bunkers* is included under demand on the country level.

The following conversion factors are used, in general, for all countries and all years.

Conversion factors		
Petroleum products	**barrels per tonne**	
Refinery gas	8.00	
Ethane	16.85	
LPG	11.60	
Naphtha	8.50	(8.90 OECD Europe)
Aviation gasoline	8.90	
Motor gasoline	8.53	(8.45 OECD Europe)
Jet gasoline	7.93	(8.25 OECD)
Jet kerosene	7.93	(7.88 OECD Europe)
Other kerosene	7.74	(7.88 OECD Europe)
Gas/diesel oil	7.46	
Heavy fuel oil	6.66	(6.45 OECD Europe)
White spirit	7.00	(8.46 OECD)
Lubricants	7.09	
Bitumen	6.08	
Paraffin waxes	7.00	(7.85 OECD)
Petroleum coke	5.50	
Non specified products	7.00	(8.00 OECD)

5. GEOGRAPHICAL COVERAGE

Africa includes Algeria, Angola, Benin, Botswana (from 1981), Cameroon, Congo, Democratic Republic of Congo, Côte d'Ivoire, Egypt, Eritrea, Ethiopia, Gabon, Ghana, Kenya, Libyan Arab Jamahiriya, Morocco, Mozambique, Namibia (from 1991), Nigeria, Senegal, South Africa, Sudan, United Republic of Tanzania, Togo, Tunisia, Zambia, Zimbabwe and **Other Africa**.

Other Africa includes Botswana (until 1980), Burkina Faso, Burundi, Cape Verde, Central African Republic, Chad, Comoros, Djibouti, Equatorial Guinea, Gambia, Guinea, Guinea-Bissau, Lesotho, Liberia, Madagascar, Malawi, Mali, Mauritania, Mauritius, Namibia (until 1990), Niger, Reunion, Rwanda, Sao Tome and Principe, Seychelles, Sierra Leone, Somalia, Swaziland and Uganda.

Middle East includes Bahrain, Islamic Republic of Iran, Iraq, Israel, Jordan, Kuwait, Lebanon, Oman, Qatar, Saudi Arabia, Syrian Arab Republic, United Arab Emirates and Yemen.

Non-OECD Europe includes Albania, Bosnia and Herzegovina, Bulgaria, Croatia, Cyprus[1], Gibraltar, Former Yugoslav Republic of Macedonia (FYROM), Malta, Romania, Serbia[2] and Slovenia.

Former Soviet Union includes Armenia, Azerbaijan, Belarus, Estonia, Georgia, Kazakhstan, Kyrgyzstan, Latvia, Lithuania, Republic of Moldova, Russian Federation, Tajikistan, Turkmenistan, Ukraine and Uzbekistan.

Latin America includes Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, Dominican Republic, Ecuador, El Salvador, Guatemala, Haiti, Honduras, Jamaica, Netherlands Antilles, Nicaragua, Panama, Paraguay, Peru, Trinidad and Tobago, Uruguay, Venezuela and **Other Latin America**.

Other Latin America includes Antigua and Barbuda, Aruba, Bahamas, Barbados, Belize, Bermuda, British Virgin Islands, Cayman Islands, Dominica, Falkland Islands, French Guyana, Grenada, Guadeloupe, Guyana, Martinique, Montserrat, Puerto Rico[3] (for natural gas), St. Kitts and Nevis, Saint Lucia, Saint Pierre et Miquelon, St. Vincent and the Grenadines, Suriname, and Turks and Caicos Islands.

China includes the People's Republic of China and Hong Kong (China).

Asia includes Bangladesh, Brunei Darussalam, Cambodia (from 1995), Chinese Taipei, India, Indonesia, DPR of Korea, Malaysia, Mongolia (from 1985), Myanmar, Nepal, Pakistan, Philippines, Singapore, Sri Lanka, Thailand, Vietnam and **Other Asia**.

Other Asia includes Afghanistan, Bhutan, Cambodia (until 1994), Cook Islands, East Timor, Fiji, French Polynesia, Kiribati, Laos, Macau, Maldives, Mongolia (until 1984), New Caledonia, Papua New Guinea, Samoa, Solomon Islands, Tonga and Vanuatu.

The **Organisation for Economic Co-Operation and Development (OECD)** includes Australia, Austria, Belgium, Canada, the Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Japan, Korea, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, the Slovak Republic, Spain, Sweden, Switzerland, Turkey, the United Kingdom and the United States.

The **European Union - 27 (EU-27)** includes Austria, Belgium, Bulgaria, Cyprus[1], the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Poland, Portugal, Romania, the Slovak Republic, Slovenia, Spain, Sweden and the

1. See the note on Cyprus in Part I.6, Country notes and sources.
2. Serbia includes Montenegro until 2004 and Kosovo until 1999.
3. Oil statistics as well as coal trade statistics for Puerto Rico are included under the United States.

United Kingdom. Please note that in the interest of having comparable data, all these countries are included since 1990 despite different entry dates into the European Union.

Within **OECD**:

- **Australia** excludes the overseas territories;
- **Denmark** excludes Greenland and the Danish Faroes, except prior to 1990, where data on oil for Greenland were included with the Danish statistics. The Administration is planning to revise the series back to 1974 to exclude these amounts;
- **France** includes Monaco, and excludes the following overseas departments and territories (Guadeloupe, Guyana, Martinique, New Caledonia, French Polynesia, Reunion and St.-Pierre Miquelon);
- **Germany** includes the new federal states of Germany from 1970 onwards;
- **Italy** includes San Marino and the Vatican;
- **Japan** includes Okinawa;
- **The Netherlands** excludes Suriname and the Netherlands Antilles;
- **Portugal** includes the Azores and Madeira;
- **Spain** includes the Canary Islands;
- **Switzerland** includes Liechtenstein for oil data;
- **United States** includes the 50 states and the District of Columbia. Oil statistics as well as coal trade statistics also include Puerto Rico[4], Guam, the Virgin Islands, American Samoa, Johnston Atoll, Midway Islands, Wake Island and the Northern Mariana Islands.

The Organisation of the Petroleum Exporting Countries[5] (OPEC) includes Algeria, Angola, Ecuador, Iran, Iraq, Kuwait, Libyan Arab Jamahiriya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates and Venezuela.

Please note that the following countries have not been considered due to lack of data:

- **Non-OECD Europe**: Liechtenstein[6] (except for oil data), Montenegro[7] (after 2004);
- **Africa:** Saint Helena and Western Sahara;
- **America:** Anguilla;
- **Asia** and **Oceania:** Christmas Island, Nauru, Niue and Palau.

4. Natural gas data for Puerto Rico are included under Other Latin America.
5. Data for Indonesia, which left OPEC in 2009, were removed from OPEC in this year's edition of this publication.
6. Oil data for Liechtenstein are included under Switzerland.
7. Data for Montenegro are included under Serbia until 2004.

- The OLADE database was used for several Latin American countries.
- The UN database was the only source of information for time series of the countries not listed individually and included in the regions Other Africa, Other Latin America and Other Asia. It was also used in a number of other countries as a complementary source.

Albania

For 1993, large quantities of oil, widely reported to have moved through Albania into former Yugoslavia, may not be included in oil trade. Although estimated to represent up to 100 per cent of domestic consumption levels, no reliable figures for this trade were available.

1. The national energy balance of Brazil shows bioethanol as two separate products: anhydrous ethanol ("álcool anidro", i.e. nearly pure ethanol, containing less than 1% of water) and hydrated ethanol ("álcool hidratado", i.e. a blend of ethanol and water, in the proportion of about 95% to 5%, generally obtained from conventional distillation). While anhydrous ethanol is blended with gasoline (the blend sold at the pump generally contains 20-25% of ethanol), hydrated ethanol is sold at separate pumps as a product by itself (álcool) to be used in flex fuel cars, i.e. vehicles that can run on any mix of gasoline and ethanol.

Secretariat estimates based on 1991 data from *Forests and Biomass Sub-sector in Africa.* African Energy Programme of the African Development Bank, Abidjan, 1996.

Chile

In this edition, time series 1990-2007 were significantly revised based on the new submission of IEA/Eurostat/ UNECE annual questionnaires provided by the national administration of Chile. Revisions are also expected in the next edition, as the national administration is currently working to make their data collection closer to international methodologies for energy statistics and to generally improve their data quality.

A significant increase in electricity generation from oil products was reported for 2007 as a consequence of decreased availability of natural gas and hydro generation in the country.

People's Republic of China

Time series for liquid biofuels were included for the first time in this year's edition. Time series for wind, solar photovoltaic and solar thermal generation are based on Secretariat estimates. Neither of those time series is reported in the national energy balance of China.

The IEA data of coal production for the years 1990 to 2003 are estimates and do not represent official data released by the Chinese government. Those estimates were based on the assumption that coal consumption statistics are more reliable than coal production statistics, and that the production-consumption relationship should maintain a balance over time.

Cyprus

Note by Turkey:

With respect to Cyprus, Turkey reserves its position as stated in its declaration of 1 May 2004. The information in the report under the heading Cyprus relates to the southern part of the Island. There is no single authority representing both Turkish and Greek Cypriot people on the Island. Turkey recognises the Turkish Republic of Northern Cyprus (TRNC).

Note by all the European Union Member States of the OECD and the European Commission:

The Republic of Cyprus is recognised by all members of the United Nations with the exception of Turkey. The information in this report relates to the area under the effective control of the Government of the Republic of Cyprus.

Russian Federation

Data for the Russian Federation are available starting in 1990. Prior to that, they are included in Former Soviet Union.

In 2007, the Federal State Statistics Service has introduced a new classification, the Russian Classification of Economic Activities (OKVED), oriented towards the harmonization with the Statistical Classification of Economic Activities in the European Community (NACE Rev.1). Data for the years prior to 2005 were submitted to the Secretariat according to the Russian Classification of the Industries of the Economy (OKONKH). Therefore, breaks in time series for final consumption sectors may occur between 2004 and 2005.

Former Soviet Union

Data for individual countries of the Former Soviet Union are available starting in 1990, and most of the information on 1990 and 1991 was estimated by the IEA Secretariat. Because of large breaks in reporting occurred in the early 1990's, breaks may occur in 1990 for all regional totals.

Coal production statistics refer to unwashed and unscreened coal up to 1990. IEA coal statistics normally refer to coal after washing and screening for the removal of inorganic matter. Also, see notes under 'Classification of Fuel Uses' and 'Heat', in Part I.1, Issues of data quality.

The commodity balances presented for the Former Soviet Union include Secretariat estimates of fuel consumption in the main categories of transformation. These estimates are based on secondary sources and on isolated references in FSU literature.

In old editions of this publication, intra-FSU trade was excluded.

Ukraine

Data for Ukraine are available starting in 1990. Prior to that, they are included in Former Soviet Union.

The State Statistics Committee submitted detailed final consumption data for coal and natural gas for the first time in 2006. Therefore, breaks in time series may occur between 2003 and 2004.

Official Ukrainian coal statistics refer to unwashed and unscreened coal prior to 1995. IEA statistics normally refer to coal after washing and screening for the removal of inorganic matter. Therefore, the IEA revised Ukrainian coal supply and demand statistics downward to reflect levels of washed coal.

Former Yugoslavia

Data for individual countries of the Former Yugoslavia are available starting in 1990, and most of the information on 1990 and 1991 was estimated by the IEA Secretariat. Because of large breaks in reporting occurred in the early 1990's, breaks may occur in 1990 for all regional totals.

Sources 1990 to 2007:

From 1990 onwards, the statistics for the Former Yugoslavia have been calculated by adding together the basic statistics of the individual countries: Croatia, Slovenia, Former Yugoslav Republic of Macedonia, Bosnia-Herzegovina, and Serbia[2]. In the case of the

2. Serbia includes Montenegro until 2004 and Kosovo until 1999.

latter two, the quality of data beyond basic production flows is questionable. Oil imports into Former Yugoslavia, breaking the UN embargo of Serbia are theoretically included, although the absolute levels of this trade are not known with any certainty.

Other Africa, Other Latin America and Other Asia

The series for these regions are obtained by adding data corresponding to their individual countries (see lists in Part I.5, Geographical coverage). As a consequence, intra-regional trade is included as part of total trade. Therefore, trade is likely to be overstated.

1. DE LA QUALITE DES DONNEES

Méthodologie

Des efforts considérables ont été déployés pour veiller à ce que les données présentées dans cette publication correspondent aux définitions de l'AIE figurant dans les parties I.2, Notes générales et I.3, Notes concernant les sources d'énergie. Ces définitions sont utilisées par la plupart des organisations internationales qui recueillent des statistiques sur l'énergie. Toutefois, les statistiques nationales sur l'énergie communiquées à ces organisations sont souvent fondées sur des critères et définitions qui diffèrent, parfois sensiblement, de ceux qu'elles emploient. On trouvera ci-après des informations sur les différences repérées par le Secrétariat de l'AIE et sur les ajustements qu'il a pu, le cas échéant, opérer pour faire correspondre les données aux définitions internationales. Les différences notoires relevées dans certains pays sont signalées dans la partie I.6, Notes et sources par pays. Les notes par pays indiquent seulement quelques-unes des déviations les plus importantes et les plus évidentes constatées dans certains pays par rapport à la méthodologie de l'AIE, et ne constituent en aucun cas une liste exhaustive des différences et anomalies par pays.

Estimation

Outre les ajustements opérés pour compenser les différences de définition, des estimations se révèlent parfois nécessaires pour compléter certains agrégats importants pour lesquels il manque des statistiques essentielles. On en trouvera des exemples dans les notes plus détaillées proposées ci-dessous. Le Secrétariat s'est attaché à fournir tous les éléments des bilans par produit jusqu'à la consommation finale pour tous les pays et toutes les années. Il a fallu pour cela indiquer les éléments de l'offre ainsi que les entrées de combustibles primaires et les sorties de combustibles secondaires correspondant aux principales activités de transformation telles que le raffinage du pétrole et la production d'électricité. Des estimations ont souvent dû être établies, après consultation d'offices statistiques nationaux, de compagnies pétrolières, de compagnies d'électricité et d'experts nationaux en matière d'énergie.

Séries chronologiques et changements politiques

Les bilans par produit des républiques de l'ex-Union Soviétique et de l'ex-Yougoslavie ont été établis à partir de 1990 et ne sont pas disponibles pour les années précédentes. Ces bilans ont été établis à l'aide de données officielles et, lorsque cela a été nécessaire, des estimations ont été effectuées à partir de données obtenues auprès de diverses industries et d'autres organisations internationales.

Les statistiques énergétiques de certains pays ont subi diverses modifications soit au niveau des données prises en compte soit de la méthodologie utilisée. En conséquence, certaines « ruptures de séries » apparaissent inévitables.

Le Secrétariat de l'AIE réexamine ses bases de données chaque année. A la lumière des nouvelles évaluations, d'importantes révisions sont apportées aux séries chronologiques des pays. En conséquence, certaines données de la présente publication ont été sensiblement révisées par rapport aux précédentes éditions. Veuillez vous référer aux notes relatives des différents pays.

Classification des utilisations des combustibles

Les sources statistiques nationales manquent souvent d'informations adéquates concernant la consommation de combustibles suivant les différentes catégories d'utilisations finales. Beaucoup de pays ne font pas d'enquêtes annuelles de la consommation de combustibles dans les principaux secteurs de l'économie, c'est pourquoi les données publiées sont fondées sur des enquêtes anciennes. La ventilation par secteurs de la consommation dans les différents pays doit donc être interprétée avec prudence.

Avant les réformes entreprises dans les années 1990, la classification sectorielle de la consommation de combustibles dans les économies en transition (de l'Europe de l'Est et de l'ex-Union Soviétique) et en Chine était très différente de celle pratiquée dans les économies de marché. La consommation sectorielle était définie d'après la branche de l'économie à laquelle appartenait l'utilisateur du combustible et non d'après la vocation ou l'usage du combustible. Par exemple, la consommation d'essence des véhicules d'une entreprise appartenant au secteur de la sidérurgie faisait partie de la consommation industrielle d'essence du secteur de la sidérurgie. Les données ont été ajustées dans la mesure du possible pour correspondre aux classifications internationales : par exemple, la totalité de la consommation d'essence est supposée relever du secteur des transports et est reportée comme telle dans la présente publication. Cependant, il n'a pas été possible de reclasser tous les produits aussi facilement que l'essence et le carburéacteur, et peu d'ajustements ont été opérés sur les autres produits.

Importations et exportations

Les importations et les exportations pour un produit donné peuvent ne pas correspondre à l'échelle du monde pour plusieurs raisons. La principale est que les produits peuvent être classifiés différemment (par exemple le fioul lourd exporté reporté en tant que produits d'alimentation des raffineries importés, ou les liquides de gaz naturel exportés reportés en tant que GPL importé). D'autres explications portent sur les facteurs de conversion (qui peuvent diverger d'un pays à l'autre), l'inclusion des soutes maritimes internationales dans les exportations, les décalages de calendrier, le report des données sur la base de l'année fiscale au lieu de l'année calendaire pour certains pays et la sous-estimation des importations et des exportations pour raisons fiscales.

Problèmes particuliers par combustible

Pétrole

Le Secrétariat de l'AIE recueille des statistiques très complètes concernant l'offre et la consommation de pétrole, y compris l'autoconsommation des raffineries, les soutes maritimes et le pétrole utilisé en pétrochimie. Les statistiques nationales font rarement état de ces chiffres. La production indiquée de produits raffinés correspond souvent à la production nette, et non brute, des raffineries et la consommation de produits pétroliers se limite parfois aux ventes sur les marchés intérieurs et ne comprend pas les livraisons aux transports internationaux maritimes ou aériens. Le pétrole utilisé comme produit de base en pétrochimie dans des complexes intégrés de raffinage/pétrochimie n'est souvent pas comptabilisé dans les statistiques officielles disponibles.

Lorsque cela est possible, le Secrétariat procède, en consultation avec l'industrie pétrolière, à une estimation des données non communiquées. En l'absence de toute autre indication sur l'utilisation de combustibles par les raffineries, la consommation des raffineries a été estimée à environ 5 pour cent des entrées en raffinerie et divisée à parts égales entre le gaz de raffinerie et le fioul lourd.

Pour une description des ajustements apportés à la consommation sectorielle de produits pétroliers, se reporter au paragraphe ci-devant intitulé « Classification des utilisations des combustibles ».

Gaz naturel

L'AIE définit la production de gaz naturel comme la production commercialisable, c'est-à-dire nette des pertes à l'extraction et des quantités brûlées à la torchère, rejetées et réinjectées. De plus, le gaz naturel doit être constitué essentiellement de méthane, et les autres gaz tels que l'éthane et les hydrocarbures à chaîne plus longue doivent être comptabilisés dans la rubrique « pétrole ».

Toutefois, les données directement disponibles sur le gaz naturel n'indiquent souvent pas le détail des pertes à l'extraction ainsi que des quantités brûlées à la torchère, rejetées et réinjectées. Les données communiquées sont rarement accompagnées de définitions adéquates, c'est pourquoi il est difficile, voire impossible,

d'identifier le gaz aux différents stades de sa séparation en gaz sec (méthane) et en fractions plus lourdes dans les installations de séparation.

Les statistiques concernant l'offre et la demande de gaz naturel sont généralement exprimées en unités de volume et il est difficile d'obtenir des données précises sur le pouvoir calorifique du gaz. Lorsque ce chiffre n'est pas connu, un pouvoir calorifique supérieur de 38 TJ/million de m^3 a été appliqué.

Signalons par ailleurs qu'il est souvent difficile d'obtenir des données fiables sur la ventilation de la consommation de gaz naturel. Cette constatation s'applique tout particulièrement à certains des plus grands pays consommateurs de gaz naturel du Moyen-Orient. Pour cette raison, la consommation industrielle de gaz naturel de ces pays n'est souvent pas indiquée dans les données figurant dans la présente publication.

Electricité

Comme l'indiquent les Notes générales (partie I.2), on appelle autoproducteur d'électricité une entreprise qui, en plus de ses activités principales, produit de l'énergie électrique destinée en totalité ou en partie à couvrir ses besoins propres. Les pays non membres de l'OCDE disposent rarement de données répondant à cette définition. Pour ces pays, les entrées de combustibles correspondant à l'autoproduction d'électricité sont indiquées dans la rubrique utilisation finale industrielle.

Lorsqu'il existe des statistiques concernant la production d'électricité à partir d'énergies Renouvelables Combustibles et de Déchets, elles sont inclues dans la production totale d'électricité. Ces données ne sont pas complètes : par exemple, l'électricité produite à partir des déchets végétaux des sucreries n'est généralement pas indiquée.

Les entrées de combustibles utilisés pour produire de l'électricité sont estimées (lorsqu'elles ne sont pas communiquées) à l'aide de données sur la production d'électricité, le rendement énergétique et le type d'installation de production.

Chaleur

Les économies en transition (d'Europe de l'Est et de l'ex-Union Soviétique) et la Chine utilisaient, s'agissant de la chaleur, une méthodologie qui les démarquait des pratiques communément adoptées dans les économies de marché. Cette méthodologie consistait à comptabiliser la transformation par l'industrie de combustibles primaires (charbon, pétrole et gaz) en chaleur destinée à la *consommation sur place* dans l'activité de transformation production de chaleur et non dans la consommation industrielle, comme le prévoit la méthodologie de l'AIE[1] ; la production de chaleur était ensuite répartie entre les différents secteurs d'utilisation finale. Les pertes survenant pendant la transformation des combustibles en chaleur par l'industrie n'étaient pas comptabilisées dans la consommation industrielle finale.

Bien que plusieurs pays aient récemment adopté la pratique des organisations internationales, cette différence non négligeable limite la validité des comparaisons entre les pays en transition et les économies de marché pour ce qui est de la consommation finale par secteur.

Energies renouvelables combustibles et déchets

L'AIE publie les données de production, d'approvisionnement intérieur et de consommation en énergies renouvelables combustibles et en déchets de tous les pays non membres de l'OCDE et toutes les régions.

Ces données proviennent souvent de sources secondaires, elles ne sont pas harmonisées et leur qualité est douteuse, ce qui rend difficile les comparaisons entre les pays. Les données historiques de nombreux pays proviennent d'enquêtes souvent irrégulières, non harmonisées et menées à un niveau local plutôt que national. Elles ne sont donc comparables ni entre régions ni dans le temps.

Lorsque des séries chronologiques étaient incomplètes ou non disponibles, le Secrétariat a procédé à l'estimation des données selon une méthodologie compatible avec le cadre prévisionnel de l'édition 1998 de l'ouvrage de l'AIE intitulé *World Energy Outlook* (septembre 1998). Premièrement, l'approvisionnement intérieur par habitant de biomasse et de déchets a été calculé ou estimé pour 1995. Deuxièmement, l'approvisionnement par habitant a été estimé pour les années 1971 à 1994 en utilisant une équation log/log avec comme variable exogène soit le PIB par habitant, soit le taux d'urbanisation, selon la région. Troisièmement, l'approvisionnement total de biomasse et de déchets après 1996 a été estimé en supposant un taux de croissance soit constant, soit égal à la croissance de la population, soit conforme à l'estimation sur la période 1971-1994. Cependant, ces séries historiques estimées doivent être traitées avec prudence.

Le tableau ci-dessous fournit des indications sommaires sur la qualité des données et la méthode d'estimation par région.

1. Pour les autoproducteurs, la méthodologie internationale ne comptabilise la chaleur dans le secteur de transformation que dans la mesure où elle est vendue à des tiers. Voir la définition dans la partie I.2.

Région	Principales sources de données	Qualité des données	Variable exogène
Afrique	base de données FAO et BAfD	faible	taux de croissance de la population
Amérique latine	nationales et OLADE	élevée	aucune
Asie	enquêtes	élevée à faible	taux de croissance de la population
Europe non-OCDE	questionnaires et FAO	élevée à moyenne	aucune
ex-Union Soviétique	Nationales, questionnaires et FAO	élevée à moyenne	aucune
Moyen-Orient	FAO	moyenne à faible	aucune

Tous les éléments des bilans jusqu'à la consommation par usage ont été compilés par produit ou catégorie de produits pour tous les pays.

Les données pour les années 2006 et 2007 sont fournies dans les tableaux annuels. La production de charbon de bois est fournie dans les tableaux récapitulatifs. Les valeurs confirment l'importance des énergies d'origine végétale dans le secteur énergétique de nombreux pays en voie de développement.

L'AIE espère que l'inclusion de ces données encouragera les administrations et les autres agences spécialisées à améliorer la qualité et étendre la couverture de la collecte des données de biomasse. Plus de détails sur la méthode suivie par pays peuvent être obtenus sur demande, et les commentaires sont bienvenus.

2. NOTES GENERALES

Les tableaux couvrent l'ensemble des sources « commerciales » d'énergie, c'est-à-dire à la fois les sources primaires (houille, lignite, tourbe, gaz naturel, pétrole brut, liquides de gaz naturel (LGN) et énergies hydraulique, géothermique/solaire, éolienne, énergie des marées/vagues/courants marins, etc. ainsi que l'énergie nucléaire) et les sources secondaires (dérivés du charbon, gaz manufacturés, produits pétroliers, électricité et chaleur). Des données sont également indiquées pour diverses sources d'énergies renouvelables combustibles et de déchets, telles que la biomasse solide, la biomasse liquide, le biogaz, les déchets urbains et les déchets industriels.

Chaque tableau est divisé en trois parties principales: la première récapitulant les éléments de *l'approvisionnement ;* la deuxième faisant état des secteurs *transformation* et *énergie ;* et la troisième indiquant la *consommation finale* ventilée entre les divers secteurs d'utilisation finale.

La description ci-dessus concerne les bilans par produit complets. Dans le cas des bilans régionaux et des bilans agrégés les définitions des produits sont les mêmes que pour les bilans complets. Cependant, la ventilation par secteur est réduite aux principaux totaux (secteur énergie, etc.) et à des catégories de consommation choisies (sidérurgie, etc.).

Approvisionnement

La première partie du bilan énergétique de base fournit les éléments suivants de l'approvisionnement :

Production
\+ *Apports d'autres sources*
\+ *Importations*
\- *Exportations*
\- *Soutes maritimes internationales*
\- *Soutes aériennes internationales*[1]
± *Variations des stocks*
= *Approvisionnement intérieur*

La ***production*** comprend les quantités de combustibles extraites ou produites, après extraction des matières inertes ou des impuretés (par exemple, après extraction du soufre contenu dans le gaz naturel). Pour les « autres hydrocarbures » (compris dans la catégorie pétrole brut), la production comprend le pétrole brut de synthèse (y compris les huiles minérales extraites de minéraux bitumineux tels que les schistes, les sables asphaltiques, etc.). La production de produits pétroliers secondaires correspond à la production brute des raffineries. La production de produits houillers et de gaz secondaires représente celle des fours à coke, des usines à gaz et des hauts fourneaux, ainsi que celle de produits de ce type issus d'autres procédés de transformation.

La rubrique ***apports d'autres sources*** concerne aussi bien l'énergie primaire qui n'a pas été prise en compte à la rubrique production que l'énergie secondaire comptabilisée dans la production d'un autre combustible. Par exemple, pour les additifs : le benzol, l'alcool et le méthanol produits à partir du gaz naturel ; pour les produits d'alimentation des raffineries : les quantités renvoyées par l'industrie pétrochimique et utilisées comme produits d'alimentation des raffineries ; pour les « autres hydrocarbures » (compris dans la catégorie pétrole brut) : les liquides obtenus à l'issue de la liquéfaction de charbon et dans les usines de production de GTL ; pour le charbon primaire : les schlamms et les mixtes, la poussière récupérée et d'autres produits charbonniers de basse qualité, qui ne sont pas classables

1. Dans cette édition, les soutes aériennes internationales ne sont plus comprises dans le secteur des transports au niveau d'un pays. Elles sont déduites de l'approvisionnement de la même manière que les soutes maritimes internationales.

d'après le type de charbon d'origine ; pour le gaz d'usine à gaz : le gaz naturel, le gaz de raffinerie et les GPL, traités ou mélangés dans les usines à gaz (c'est-à-dire, gaz d'usine à gaz produit à partir d'autres sources que le charbon).

La rubrique ***importations*** et ***exportations*** désigne les quantités de produits ayant franchi les frontières du territoire national, que le dédouanement ait été effectué ou non.

Pour le charbon : les importations et exportations comprennent les quantités de combustibles obtenues d'autres pays ou fournies à d'autres pays, qu'il existe ou non une union économique ou douanière entre les pays en question. Le charbon en transit ne devrait pas être pris en compte.

Pour le pétrole et le gaz : cette rubrique comprend les quantités de pétrole brut et de produits pétroliers importées ou exportées au titre d'accords de traitement (à savoir, raffinage à façon). Les quantités de pétrole en transit ne sont pas prises en compte. Le pétrole brut, les LGN et le gaz naturel sont répertoriés en fonction de leur pays d'origine. Pour les produits d'alimentation des raffineries et les produits pétroliers, en revanche, c'est le dernier pays de provenance qui est pris en compte. Les réexportations de pétrole importé pour raffinage en zone franche sont comptabilisées dans les exportations de produits pétroliers par le pays de raffinage vers le pays de destination finale.

Pour l'électricité : les quantités sont considérées comme importées ou exportées lorsqu'elles ont franchi les limites territoriales du pays. Si l'électricité transite par un pays, la quantité correspondante est comptabilisée à la fois dans les importations et les exportations.

Les ***soutes maritimes internationales*** correspondent aux quantités fournies aux navires engagés dans la navigation internationale. La navigation internationale peut intervenir en mer, sur des lacs et des cours d'eau, ainsi que dans les eaux côtières. La consommation des navires engagés dans la navigation intérieure n'est pas prise en compte. La différenciation entre navigation intérieure et internationale est fonction du port de départ et du port d'arrivée, et non du pavillon ou de la nationalité du navire. La consommation des navires de pêche et des forces militaires n'est pas prise en compte non plus. Voir les définitions des secteurs des *transports*, de la *pêche* et des *« autres secteurs » non spécifiés*.

Les ***soutes aériennes internationales*** correspondent aux livraisons de carburants pour les aéronefs utilisés dans l'aviation internationale. Les carburants utilisés par les compagnies aériennes pour leurs véhicules routiers ne sont pas pris en considération. La différenciation entre aviation intérieure et internationale devrait être établie en fonction des aéroports de départ et d'arrivée, et non de la nationalité de la compagnie aérienne. Pour nombre de pays, cette rubrique ne comptabilise pas, à tort, les quantités de carburant utilisées par des transporteurs nationaux pour leurs vols internationaux.

Note : En octobre 2008 s'est tenue à l'AIE la troisième réunion InterEnerStat. Ce groupe se compose de 24 organisations internationales qui collectent et utilisent des statistiques sur l'énergie. L'un des objectifs de ce groupe est d'améliorer la qualité des données sur l'énergie en harmonisant les définitions des sources et des flux d'énergie. A la suite de cette réunion, l'AIE a décidé d'aligner ses statistiques et ses bilans énergétiques sur la plupart des autres organisations internationales et de traiter les soutes aériennes internationales comme les soutes maritimes internationales. A partir de cette édition, les soutes aériennes internationales ne sont plus comptabilisées dans le secteur des transports au niveau du pays. Elles sont déduites de l'approvisionnement de la même manière que les soutes maritimes internationales.

Les ***variations des stocks*** expriment la différence enregistrée entre le premier jour et le dernier jour de l'année dans le niveau des stocks détenus sur le territoire national par les producteurs, les importateurs, les entreprises de transformation de l'énergie et les gros consommateurs. Les variations des quantités de pétrole et de gaz stockées dans les oléoducs et les gazoducs ne sont pas prises en compte. Sauf chez les gros consommateurs susmentionnés, les variations des stocks des utilisateurs finaux ne sont pas comptabilisées. Une augmentation des stocks est indiquée par un chiffre négatif, tandis qu'une diminution est affectée d'un chiffre positif.

L'***approvisionnement intérieur*** est ainsi défini : *production + apports d'autres sources + importations – exportations – soutes maritimes internationales – soutes aériennes internationales ± variations des stocks.*

La rubrique ***transferts*** comprend les lignes *transferts entre produits*, *produits transférés* et *produits recyclés*.

Les *transferts entre produits* visent les produits dont le classement a changé, soit parce que leurs spécifications ont été modifiées, soit parce qu'ils ont été mélangés pour former un autre produit. Ainsi, le kérosène peut être reclassé comme gazole après mélange avec ce dernier produit pour obtenir un gazole conforme aux spécifications hivernales. Le solde net des *transferts entre produits* est nul.

Les *produits transférés* sont des produits pétroliers importés pour subir un traitement complémentaire dans des raffineries. Par exemple : le fioul importé pour conversion dans une raffinerie est transféré dans la catégorie des produits d'alimentation.

Les *produits recyclés* sont des produits finis qui sont remis dans le circuit commercial, **après** avoir été livrés une première fois au consommateur final (par exemple les lubrifiants usés qui sont régénérés).

L'***écart statistique*** comprend, par définition, les livraisons destinées à la *consommation finale* + les quantités utilisées pour la *transformation* et la consommation dans le secteur de *l'énergie* + les *pertes de distribution* – l'*approvisionnement intérieur* – les *transferts*. En effet, les écarts statistiques proviennent des données relatives aux différentes composantes de l'approvisionnement qui sont souvent tirées par l'administration nationale de sources différentes. En outre, la prise en compte des variations des stocks de certains gros consommateurs dans la partie approvisionnement du bilan crée des distorsions qui contribuent aux écarts statistiques.

Secteur transformation

Le secteur transformation englobe les activités de transformation des formes d'énergie primaire en énergie secondaire, et de transformation ultérieure (par exemple, celle du charbon à coke en coke, du pétrole brut en produits pétroliers, du fioul lourd en électricité).

Centrales électriques désigne les centrales conçues pour produire uniquement de l'électricité. Si une unité ou plus de la centrale est une installation de cogénération (et que l'on ne peut pas comptabiliser séparément, sur une base unitaire, les combustibles utilisés et la production), elle est considérée comme une centrale de cogénération. Tant les centrales des producteurs dont la production d'électricité est l'activité principale (précédemment appelées centrales publiques)[2] que les installations des autoproducteurs[3] entrent dans cette rubrique. La chaleur issue de procédés chimiques pour la production d'électricité est également comptabilisée dans cette rubrique.

Centrales de cogénération chaleur/électricité désigne les centrales conçues pour produire de la chaleur et de l'électricité, parfois appelées « installations de production combinée d'énergie électrique et de chaleur ». Dans la mesure du possible, les consommations de combustibles et les productions de chaleur/électricité doivent être exprimées sur la base des unités plutôt que des centrales. Cependant, à défaut de données disponibles exprimées sur une base unitaire, il convient d'adopter la convention indiquée ci-dessus pour la définition d'une centrale de cogénération. Tant les centrales des producteurs dont la production est l'activité principale (auparavant, centrales publiques) que les installations des autoproducteurs entrent dans cette rubrique. *On notera que, dans le cas des installations de cogénération chaleur/électricité des autoproducteurs, sont comptabilisés tous les combustibles utilisés pour la production d'électricité, tandis que seule la partie des combustibles utilisés pour la production de chaleur vendue est indiquée. Les combustibles utilisés pour la production de la chaleur destinée à la consommation interne des autoproducteurs ne sont pas comptabilisés dans cette rubrique mais dans les données concernant la consommation finale de combustibles du secteur de consommation approprié.*

Centrales calogènes désigne les installations (pompes à chaleur et chaudières électriques comprises) conçues pour produire uniquement de la chaleur et qui en vendent à des tiers (par exemple, consommateurs des secteurs résidentiel, commercial ou industriel) selon les termes d'un contrat. Tant les centrales des producteurs dont la production est l'activité principale (auparavant, centrales publiques) que les installations des autoproducteurs entrent dans cette rubrique. Les pompes à chaleur utilisées dans le secteur résidentiel qui ne donnent pas lieu à des ventes de chaleur ne sont pas considérées comme étant une activité de transformation et ne sont pas comptabilisées dans cette rubrique – la consommation d'électricité figurera en tant que consommation résidentielle.

Hauts fourneaux et usines à gaz couvre les quantités de combustibles utilisées pour la production de gaz de ville, de gaz de haut fourneau et de gaz de convertisseur à oxygène. Dans la production de fonte brute à partir de minerai de fer dans les hauts fourneaux, les combustibles sont utilisés pour la charge des hauts fourneaux et pour l'apport de chaleur et de carbone nécessaire à la réduction du minerai. Comptabiliser le pouvoir calorifique des combustibles qui entrent dans ce procédé est une tâche complexe, car la transformation

2. Ces producteurs ayant pour *principale activité* la production d'électricité et/ou de chaleur pour la vente à des tiers (rubrique précédemment dénommée production publique) peuvent appartenir au secteur privé ou public. Il convient de noter que les ventes ne se font pas nécessairement par l'intermédiaire du réseau public.

3. L'autoproduction désigne les installations qui produisent de l'électricité et/ou de la chaleur, en totalité ou en partie pour leur consommation propre, en tant qu'activité qui contribue à leur activité principale. Elles peuvent appartenir au secteur privé ou public.

(en gaz de haut fourneau) et la consommation (de chaleur de combustion) interviennent simultanément. Il se produit aussi une rétention de carbone dans la fonte brute ; la quasi-totalité de ce carbone réapparaît ultérieurement dans le gaz de convertisseur à oxygène (appelé aussi gaz de convertisseur ou gaz LD) lorsque la fonte brute est transformée en acier. En principe, les quantités de tous les combustibles (par exemple, charbon utilisé pour l'injection de charbon pulvérisé, coke de four à coke, gaz naturel et fioul) entrant dans les hauts fourneaux ainsi que la quantité de gaz de haut fourneau et gaz de convertisseur à oxygène produite sont recueillies. Cependant, à l'exception des entrées de coke de four, les données sont souvent douteuses ou incomplètes. Le Secrétariat a dû répartir ces apports entre les secteurs de transformation et de consommation. L'élément correspondant à la transformation est indiqué dans la ligne *hauts fourneaux et usines à gaz* à la colonne appropriée pour le combustible dont il s'agit, et l'élément correspondant à la consommation est indiqué dans la ligne *sidérurgie*, à la colonne appropriée pour le combustible dont il s'agit. A partir de l'édition de 1998, le Secrétariat a décidé de tabler sur un rendement de transformation tel que les entrées et les sorties de carbone dans les hauts fourneaux soient égales. Ceci équivaut plus ou moins à prendre pour hypothèse un rendement de transformation de l'énergie de 40 %. Cette ventilation a été estimée à partir des résultats du modèle appliqué aux pays de l'OCDE.[4] Elle fournit un équilibrage plus cohérent entre les entrées de carbone dans les hauts fourneaux et les sorties correspondantes, lorsque les données de l'AIE sont utilisées pour calculer les émissions de CO_2 dues à la combustion, en utilisant la méthodologie du Groupe d'experts intergouvernemental sur l'évolution du climat (GIEC) telle qu'elle est publiée dans *Lignes directrices révisées en 1996 du GIEC pour les inventaires nationaux de gaz à effet de serre*[5].

Cokeries/usines d'agglomérés/usines de briquettes de lignite couvre les combustibles utilisés pour la production de coke, de gaz de cokerie, d'agglomérés et de briquettes de lignite (BKB).

Raffineries de pétrole couvre les hydrocarbures utilisés pour la production de produits pétroliers finis.

Industrie pétrochimique couvre les produits renvoyés aux raffineries par l'industrie pétrochimique. Il convient de noter que les retours en raffinerie des produits pétroliers utilisés à des fins non énergétiques (à savoir, white spirit et lubrifiants) ne sont pas pris en compte dans cette rubrique, mais dans celle des utilisations non énergétiques.

Les ***unités de liquéfaction*** comprend divers procédés de liquéfaction, notamment ceux qui sont mis en œuvre dans les usines de liquéfaction du charbon et dans les installations de conversion de gaz en hydrocarbures liquides (GTL).

Secteur transformation-autres comprend la transformation de la biomasse solide en charbon de bois, le mélange d'autres gaz avec le gaz naturel et d'autres transformations non spécifiées.

Secteur énergie

Le secteur énergie englobe les quantités de combustibles utilisées par les industries productrices d'énergie (par exemple, pour la chauffe, l'éclairage et le fonctionnement de tous les équipements intervenant dans le processus d'extraction, ou encore pour la traction et la distribution).

La consommation propre du secteur de la production d'énergie comprend l'énergie consommée par les industries de transformation pour la chauffe, le pompage, la traction et l'éclairage [Divisions 10, 11, 12, 23 et 40 de la CITI][6].

Extraction de combustibles recouvre l'extraction du charbon, du pétrole et du gaz. Pour ce qui est de l'extraction de houille et de lignite, il entre dans cette rubrique l'énergie utilisée directement dans l'industrie du charbon. Cette rubrique ne tient pas compte du charbon brûlé dans les centrales électriques installées sur le carreau de la mine (qui est comptabilisé à la rubrique centrales électriques dans le secteur transformation) ni des quantités attribuées gratuitement aux mineurs et à leurs familles (considérées comme faisant partie de la consommation des ménages et comptabilisées de ce fait dans le secteur résidentiel). En ce qui concerne l'extraction de pétrole et de gaz, le gaz brûlé à la torche n'est pas pris en compte.

Raffineries de pétrole.

4. Voir *Statistiques de l'énergie des pays de l'OCDE* pour plus d'informations sur le modèle d'estimation des hauts fourneaux appliqué aux pays de l'OCDE.

5. La publication *Lignes directrices révisées en 1996 du GIEC pour les inventaires nationaux de gaz à effet de serre* est disponible auprès du Programme du GIEC sur les inventaires de gaz à effet de serre à http://www.ipcc-nggip.iges.or.jp.

6. Classification international type par industrie de toutes les branches d'activité économique, Série M, No. 4/Rév. 3, Nations Unies, New York, 1990.

Centrales électriques, centrales de cogénération et centrales calogènes.

Énergie absorbée par le pompage (électricité consommée dans les centrales hydrauliques).

Secteur énergie-autres (comprenant la consommation propre des usines d'agglomérés, des cokeries, des usines à gaz, des hauts fourneaux, des usines de briquettes et de coke de lignite, des unités de liquéfaction du charbon, des unités de conversion de gaz en hydrocarbures liquides, des unités de production de charbon de bois, des centrales nucléaires ainsi que les utilisations dans le secteur énergie non spécifiés).

Pertes de distribution

Les ***pertes de distribution*** recouvrent les pertes enregistrées lors de la distribution du gaz, du transport de l'électricité et du transport du charbon.

Consommation finale

Le terme ***consommation finale*** (qui correspond à la somme des consommations des secteurs d'utilisation finale) signifie que l'énergie utilisée pour la transformation et pour la consommation propre des industries productrices d'énergie n'est pas prise en compte. La consommation finale recouvre la majeure partie des livraisons aux consommateurs (voir la note sur les *variations des stocks*).

Les retours de produits de l'industrie pétrochimique ne sont pas pris en compte dans la consommation finale (voir *apports d'autres sources* dans la section sur l'approvisionnement et *industrie pétrochimique* dans la section sur le secteur transformation).

A partir de l'édition 2009, les soutes aériennes internationales ne sont plus comptabilisées en tant que consommation finale au niveau du pays. Pour plus de détails, veuillez-vous reporter à la note sur l'approvisionnement.

Secteur industrie

La consommation du secteur industrie est répartie entre les sous-secteurs suivants (l'énergie utilisée par l'industrie pour le transport n'est pas prise en compte ici mais figure dans la rubrique transports) :

Sidérurgie [Groupe 271 et Classe 2731 de la CITI] ;

Industrie chimique et pétrochimique [Division 24 de la CITI], à l'exclusion des produits d'alimentation de la pétrochimie.

Industries de base des ***métaux non ferreux*** [Groupe 272 et Classe 2732 de la CITI] ;

Produits minéraux non métalliques tels que verre, céramiques, ciment, etc. [Division 26 de la CITI] ;

Matériel de transport [Divisions 34 et 35 de la CITI] ;

Construction mécanique. Fabrication d'ouvrages en métaux, de machines et de matériels à l'exclusion du matériel de transport [Divisions 28, 29, 30, 31 et 32 de la CITI] ;

Industries extractives (à l'exception des combustibles) [Divisions 13 et 14 de la CITI] ;

Industrie alimentaire et tabacs [Divisions 15 et 16 de la CITI] ;

Papier, pâte à papier et imprimerie [Divisions 21 et 22 de la CITI] ;

Bois et produits dérivés (à exclusion de la pâte à papier et du papier) [Division 20 de la CITI] ;

Construction [Division 45 de la CITI] ;

Textiles et cuir [Divisions 17, 18 et 19 de la CITI] ;

Non spécifiés [7] (tout autre secteur industriel non spécifié précédemment) [Divisions 25, 33, 36 et 37 de la CITI].

Note : La plupart des pays éprouvent des difficultés à fournir une ventilation par branche d'activité pour tous les combustibles. Dans ces cas, la rubrique *non spécifiés* a été utilisée. Les agrégats régionaux de la consommation industrielle doivent donc être employés avec précaution.

Secteur transports

La consommation dans le secteur transports couvre toutes les activités de transport (liées à des moteurs mobiles) quel que soit le secteur économique concerné [Divisions 60, 61 et 62 de la CITI], et elle est ventilée entre les différents sous-secteurs suivants.

Aviation intérieure recouvre les livraisons de carburants aviation pour les aéronefs utilisés dans l'aviation intérieure - commerciale, privée, agricole, etc. Elle comprend également les quantités utilisées à des fins autres que le vol proprement dit, par exemple, l'essai de moteurs au banc, mais pas le carburant utilisé par les compagnies aériennes pour le transport routier. La différenciation entre aviation intérieure et internationale

devrait être établie en fonction des aéroports de départ et d'arrivée, et non de la nationalité de la compagnie aérienne. On notera qu'il peut entrer dans cette rubrique des parcours d'une longueur considérable entre deux aéroports d'un même pays (par exemple de San Francisco à Honolulu). Pour nombre de pays, cette rubrique comprend, à tort, les quantités de carburant utilisées par des transporteurs nationaux pour leurs vols internationaux.

Transport routier comprend la totalité des carburants utilisés dans les véhicules routiers ainsi que le carburant consommé pour les transports agricoles et industriels sur route. Il n'y est pas tenu compte de la consommation à des fins militaires, ni de l'essence moteur employée dans les moteurs fixes, ni du gazole utilisé par les tracteurs ailleurs que sur route.

Transport ferroviaire couvre toutes les quantités utilisées dans le trafic ferroviaire, y compris par les chemins de fer industriels.

Transport par conduites comprend l'énergie utilisée pour alimenter et exploiter des conduites de transport de gaz, de liquides, de pulpe de fines de charbon en suspension dans l'eau, entre autres, y compris l'énergie consommée par les stations de pompage et pour l'entretien de la conduite. L'énergie utilisée pour la distribution par canalisations de gaz naturel ou de gaz manufacturé, d'eau chaude ou de vapeur (Division 40 de la CITI) entre le distributeur et le consommateur final n'est pas prise en compte et devrait figurer à la rubrique *secteur énergie*, tandis que l'énergie utilisée pour la distribution finale de l'eau (Division 41 de la CITI) aux ménages ainsi qu'aux consommateurs industriels, commerciaux et autres, devrait être comptabilisée dans la rubrique *commerce/services publics*. Les pertes intervenant pendant le transport entre le distributeur et le consommateur final devraient être indiquées à la rubrique *pertes de distribution*.

Navigation intérieure comprend les livraisons de carburants aux navires qui ne sont pas engagés dans la navigation internationale, quel que soit leur pavillon (voir *soutes maritimes internationales*). La différenciation entre navigation intérieure et internationale devrait être établie en fonction du port de départ et du port d'arrivée, et non du pavillon ou de la nationalité du navire. On notera qu'il peut entrer dans cette rubrique des parcours d'une longueur considérable entre deux ports d'un même pays (par exemple de San Francisco à Honolulu). Le carburant utilisé pour les pêches hauturière, côtière et continentale ainsi que pour des activités militaires n'entre pas dans cette rubrique.

Non spécifiés [7] couvre toutes les quantités de combustibles consommées dans le secteur transports qui n'ont pas été précisées ailleurs.

Note : Les *soutes maritimes internationales* et les *soutes aériennes internationales* sont prises en compte dans l'*approvisionnement* et non dans le secteur transports, à l'exception de l'agrégat Monde. Par ailleurs, l'information sur la consommation relative aux activités militaires n'est pas disponible pour la majorité des pays non OCDE.

Autres secteurs

Résidentiel couvre la consommation des ménages, à l'exception des carburants utilisés dans les transports. Elle comprend les ménages employant du personnel domestique (Division 95 de la CITI), ce qui représente une faible part de la consommation résidentielle totale.

Commerce et services publics [Divisions 41, 50-52, 55, 63-67, 70-75, 80, 85, 90-93 et 99 de la CITI].

Agriculture/sylviculture couvre toutes les livraisons aux consommateurs classés dans les rubriques agriculture, chasse et sylviculture de la CITI, et comprend donc les produits énergétiques consommés par ces consommateurs que ce soit pour la traction automobile (à l'exception des carburants utilisés par les engins agricoles sur route), pour la production d'énergie ou le chauffage (dans les secteurs agricole et résidentiel) [Divisions 01 et 02 de la CITI].

Pêche concerne les carburants utilisés pour la pêche continentale, côtière et hauturière. Il y entre les carburants livrés aux navires qui se ravitaillent dans le pays, quel que soit leur pavillon (y compris pour la pêche internationale) ainsi que l'énergie utilisée dans l'industrie de la pêche [Division 05 de la CITI].

Avant l'édition de 2007, la pêche était regroupée avec l'agriculture/sylviculture, ce qui est peut-être encore le cas dans certains pays.

Non spécifiés [7] couvre toutes les quantités de combustibles consommées qui n'ont pas été précisées ailleurs ainsi que la consommation dans les catégories précitées pour lesquelles des données ventilées n'ont pas

7. Dans les tables simplifiées par pays, non-spécifiés est reporté ensemble avec les autres catégories non listées explicitement (*Other/non-specified*).

été fournies. Il est comptabilisé dans cette rubrique la consommation de combustibles ou carburants dans les activités militaires, qu'il s'agisse d'usages mobiles ou stationnaires (par exemple navires, aéronefs, véhicules routiers, énergie consommée dans les quartiers), que les combustibles ou carburants fournis soient destinés à des usages militaires du pays même ou d'un autre pays.

Utilisations non énergétiques

L'utilisation non énergétique fait référence aux combustibles utilisés dans différents secteurs en tant que matières premières. Ces combustibles ne sont pas utilisés comme énergie ou transformés en un autre combustible. L'utilisation non énergétique est présentée séparément de la consommation finale, sous la rubrique *utilisations non énergétiques*.

La séparation entre utilisations énergétiques et non énergétiques de tous les produits pétroliers est établie, pour chaque produit, sur la base des informations communiquées par les pays.

dont : produits d'alimentation de l'industrie pétrochimique. L'industrie pétrochimique comprend les opérations de craquage et de reformage destinées à la production de l'éthylène, du propylène, du butylène, du gaz de synthèse, des aromatiques, du butadiène et d'autres matières premières à base d'hydrocarbures, par exemple dans les installations de vapocraquage, les usines d'aromatiques et les unités de reformage à la vapeur [partie du Groupe 241 de la CITI].

3. NOTES CONCERNANT LES SOURCES D'ENERGIE

Charbon/tourbe

Les quantités de combustibles mentionnées dans cette section sont exprimées en milliers de tonnes.

Charbon à coke

On appelle charbon à coke un charbon d'une qualité permettant la production d'un coke susceptible d'être utilisé dans les hauts fourneaux. Son pouvoir calorifique supérieur dépasse 23 865 kJ/kg (5 700 kcal/kg), valeur mesurée pour un combustible exempt de cendres, mais humide.

Autres charbons bitumineux et anthracite

Les autres charbons bitumineux sont utilisés pour la production de vapeur et pour le chauffage des locaux. Cette catégorie comprend tout le charbon bitumineux qui n'entre pas dans celle du charbon à coke. Ces charbons se caractérisent par une teneur en matières volatiles généralement supérieure à 10 % et par une teneur en carbone relativement forte (moins de 90 % de carbone fixe). Leur pouvoir calorifique supérieur dépasse 23 865 kJ/kg (5 700 kcal/kg), valeur mesurée pour un combustible exempt de cendres, mais humide.

L'anthracite est un charbon de rang élevé utilisé pour des applications industrielles et résidentielles. Il présente généralement une teneur en matières volatiles inférieure à 10 % et une forte teneur en carbone (environ 90 % de carbone fixe). Son pouvoir calorifique supérieur dépasse 23 865 kJ/kg (5 700 kcal/kg), valeur mesurée pour un combustible exempt de cendres, mais humide.

Charbons sous-bitumineux

On appelle charbons sous-bitumineux les charbons non agglutinants d'un pouvoir calorifique supérieur compris entre 17 435 kJ/kg (4 165 kcal/kg) et 23 865 kJ/kg (5 700 kcal/kg), contenant plus de 31 % de matières volatiles sur produit sec exempt de matières minérales.

Lignite

Le lignite est un charbon non agglutinant dont le pouvoir calorifique supérieur n'atteint pas 17 435 kJ/kg (4 165 kcal/kg), et qui contient plus de 31 % de matières volatiles sur produit sec exempt de matières minérales.

Les schistes bitumineux et les sables asphaltiques produits et brûlés directement sont pris en compte dans cette rubrique. Les schistes bitumineux et les sables asphaltiques entrant dans d'autres procédés de transformation y sont également comptabilisés, ce qui recouvre la fraction de ces produits consommés dans le procédé de transformation proprement dit. L'huile de schiste et les autres produits issus de la liquéfaction figurent sous la rubrique *apports d'autres sources* dans la catégorie pétrole brut (*autres hydrocarbures*).

Tourbe

La tourbe est un sédiment fossile d'origine végétale poreux ou comprimé, combustible à haute teneur en eau (jusqu'à 90 % sur brut), facilement rayé, de couleur brun clair à brun foncé.

Coke de cokerie, coke de gaz et goudron de houille

Le coke de cokerie est un produit solide obtenu par carbonisation à haute température du charbon, et surtout du charbon à coke ; sa teneur en eau et en

matières volatiles est faible. Le coke de cokerie est essentiellement utilisé dans l'industrie sidérurgique comme source d'énergie et réactif chimique. Le semi-coke (produit solide obtenu par carbonisation à basse température) ; le coke de lignite (semi-coke obtenu à partir de lignite) ; le poussier de coke et le coke de fonderie sont également inclus dans cette rubrique. La rubrique *secteur énergie-autres* comprend la consommation interne des cokeries. La consommation de l'*industrie sidérurgique* ne comprend pas le coke transformé en gaz de haut fourneau. Pour obtenir la consommation totale de coke de cokerie de l'industrie sidérurgique, il faut ajouter les quantités de coke transformées en gaz de haut fourneau (lesquelles sont comptabilisées dans la rubrique *hauts fourneaux et usines à gaz*).

Le coke de gaz est un sous-produit de la houille utilisée pour la production de gaz de ville dans les usines à gaz. Il est principalement utilisé pour la chauffe. La rubrique *secteur énergie-autres* couvre la consommation de coke de gaz dans les usines à gaz.

Le goudron de houille est issu de la distillation destructive de charbon bitumineux. Il s'agit du sous-produit liquide de la distillation du charbon pour produire du coke en cokerie. Le goudron de houille peut faire l'objet d'une distillation supplémentaire donnant différents produits organiques (par exemple le benzène, le toluène, le naphtalène), qui devront normalement être comptabilisés comme produits d'alimentation de l'industrie pétrochimique.

Agglomérés et briquettes de lignite (et de tourbe) (BKB)

Les agglomérés sont des combustibles composites fabriqués à partir de fines de charbon par moulage avec adjonction d'un liant. La quantité d'agglomérés produite est donc légèrement supérieure au tonnage de houille effectivement utilisé dans le procédé de transformation. La consommation d'agglomérés durant le processus de fabrication des agglomérés entre dans la rubrique *secteur énergie-autres*.

Les briquettes de lignite (BKB) sont des combustibles composites fabriqués à partir du lignite, et agglomérés sous haute pression. Ces données couvrent les briquettes de tourbe, ainsi que les fines et le poussier de lignite à l'état sec. La consommation des usines de briquettes est comptabilisée dans la rubrique *secteur énergie-autres*.

Pétrole brut, LGN et produits d'alimentation des raffineries

Les quantités de combustibles mentionnées dans cette section sont exprimées en milliers de tonnes.

Pétrole brut

C'est une huile minérale, constituée d'un mélange d'hydrocarbures d'origine naturelle et d'impuretés associées, soufre par exemple. Elle existe en phase liquide aux conditions normales de température et de pression et ses caractéristiques physiques (densité, viscosité, etc.) sont extrêmement variables. Cette catégorie comprend aussi les condensats (provenant des séparateurs) extraits des gaz associés ou non associés sur les gisements et les périmètres d'exploitation lorsqu'ils sont mélangés au brut commercial.

Les autres hydrocarbures, y compris les huiles émulsionnées (par exemple, l'orimulsion), le pétrole brut synthétique, les huiles minérales extraites des roches bitumineuses telles que schistes, sables asphaltiques, etc. ainsi que les liquides issus de la liquéfaction du charbon sont comptabilisés dans cette rubrique.

Liquides de gaz naturel (LGN)

Les LGN sont des hydrocarbures liquides ou liquéfiés obtenus pendant le traitement, la purification et la stabilisation du gaz naturel. Il s'agit des fractions de gaz naturel qui sont récupérées sous forme liquide dans les installations de séparation, dans les installations sur les gisements ou dans les usines de traitement du gaz. Les LGN comprennent l'éthane, le propane, le butane, le pentane, l'essence naturelle et les condensats, sans que la liste soit limitative.

Produits d'alimentation des raffineries

Un produit d'alimentation des raffineries est un produit pétrolier raffiné destiné à subir un traitement ultérieur autre qu'un mélange dans l'industrie du raffinage (par exemple fuel-oil de distillation directe ou gazole sous vide). Il est transformé en un ou plusieurs constituants et/ou produits finis. Cette définition recouvre les produits finis qui sont importés pour la consommation des raffineries et ceux qui sont renvoyés par l'industrie pétrochimique aux raffineries.

Additifs

Les additifs sont des substances autres que des hydrocarbures qui sont ajoutées ou mélangées à un produit afin de modifier ses propriétés, pour améliorer par exemple ses caractéristiques lors de la combustion. Les alcools et les éthers (MTBE ou méthyl-tertiobutyl-éther), ou des substances telles que le plomb tétraéthyle, sont comptabilisés dans cette rubrique. La bio-essence, le biodiesel et l'éthanol, étant dérivés de la biomasse, n'entrent pas dans cette rubrique, mais dans celle de la biomasse liquide. Cette présentation des additifs n'est pas la même que celle figurant dans la publication *Données sur le pétrole*.

Produits pétroliers

Les quantités de combustibles mentionnées dans cette section sont exprimées en milliers de tonnes.

Ce sont tous les produits dérivés du pétrole qui peuvent être obtenus par distillation et qui sont, en général, utilisés en dehors de l'industrie du raffinage. Les produits finis classés comme produits d'alimentation des raffineries n'entrent pas dans cette catégorie.

Les données sur la *production* de produits pétroliers font apparaître, pour chaque produit, la production brute des raffineries.

La consommation de combustibles des raffineries (figurant dans le *secteur* énergie, ligne *raffineries de pétrole*) représente leur consommation de produits pétroliers, qu'il s'agisse de produits intermédiaires ou de produits finis, utilisés par exemple pour la chauffe, l'éclairage, la traction, etc.

Gaz de raffinerie (non liquéfiés)

Cette catégorie couvre, par définition, les gaz non condensables obtenus dans les raffineries lors de la distillation du pétrole brut ou du traitement des produits pétroliers (par craquage, par exemple). Il s'agit principalement d'hydrogène, de méthane, d'éthane et d'oléfines. Sont compris également les gaz retournés aux raffineries par l'industrie pétrochimique. La production de gaz de raffinerie correspond à la production brute. La consommation propre des raffineries est comptabilisée séparément à la ligne *raffineries de pétrole* dans la rubrique *secteur énergie*.

Gaz de pétrole liquéfiés (GPL) et éthane

Les gaz de pétrole liquéfiés sont des fractions légères d'hydrocarbures paraffiniques qui s'obtiennent lors du raffinage ainsi que dans les installations de stabilisation du pétrole brut et de traitement du gaz naturel. Ce sont le propane (C_3H_8) et le butane (C_4H_{10}) ou un mélange de ces deux hydrocarbures. Le propylène, le butylène, l'isobutène et l'isobutylène peuvent aussi en faire partie. Les GPL sont généralement liquéfiés sous pression pour le transport et le stockage.

L'éthane (C_2H_6) est un hydrocarbure à chaîne droite, gazeux à l'état naturel. C'est un gaz paraffinique incolore que l'on extrait du gaz naturel et des gaz de raffinerie.

Essence moteur

L'essence moteur est un hydrocarbure léger utilisé dans les moteurs à combustion interne, tels que ceux des véhicules à moteur, à l'exception des aéronefs. L'essence moteur est distillée entre 35°C et 215°C et utilisée comme carburant pour les moteurs terrestres à allumage commandé. L'essence moteur peut contenir des additifs, des composés oxygénés et des additifs améliorant l'indice d'octane, notamment des composés plombés comme le PTE (plomb tétraéthyle) et le PTM (plomb tétraméthyle). Il n'entre pas dans la catégorie d'essence moteur les biocarburants liquides ou l'éthanol mélangé à l'essence - voir la rubrique biomasse liquide. Cette présentation de l'essence moteur n'est pas la même que celle figurant dans la publication *Données sur le pétrole*.

Carburants aviation

Il s'agit des carburéacteurs type essence et type kérosène conformes aux spécifications d'utilisation pour les turbomoteurs pour avion. Cette catégorie comprend également de faibles volumes d'essence aviation.

Le carburéacteur type essence comprend tous les hydrocarbures légers dont la distillation intervient entre 100°C et 250°C et qui sont utilisés dans les turbomoteurs pour avion. Ce carburéacteur est obtenu par mélange de kérosènes et d'essence ou de naphtas, de sorte que la teneur en aromatiques soit égale ou inférieure à 25 % en volume, et que la tension de vapeur se situe entre 13.7 kPa et 20.6 kPa. Des additifs peuvent être ajoutés afin d'accroître la stabilité et la combustibilité du carburant.

Le carburéacteur type kérosène est un distillat moyen utilisé dans les turbomoteurs pour avion, qui répond aux mêmes caractéristiques de distillation et présente le même point d'éclair que le kérosène (entre 150°C et 300°C, mais ne dépassant pas 250°C en général). De plus, il est conforme à des spécifications particulières (concernant notamment le point de congélation), définies

par l'Association du transport aérien international (IATA). Sont compris dans cette rubrique des composants entrant dans des mélanges avec du kérosène.

L'essence aviation est une essence moteur spécialement préparée pour les moteurs à pistons des avions, avec un indice d'octane adapté au moteur, un point de congélation de -60°C et un intervalle de distillation habituellement compris entre 30°C et 180°C.

Kérosène

Le kérosène (hors kérosène utilisé pour le transport aérien, qui est comptabilisé avec les carburants aviation) comprend les distillats de pétrole raffiné dont la volatilité est comprise entre celle de l'essence et celle du gazole/carburant diesel. C'est une huile moyenne dont la distillation intervient entre 150°C et 300°C.

Gazole/carburant diesel (Distillat de coupe intermédiaire)

Les gazoles/carburants diesel sont des huiles lourdes. Les gazoles sont extraits de la dernière fraction issue de la distillation atmosphérique du pétrole brut, tandis que les gazoles lourds sont obtenus par redistillation sous vide du résidu de la distillation atmosphérique. L'intervalle de distillation du gazole/carburant diesel se situe entre 180°C et 380°C. Plusieurs qualités sont disponibles, selon l'utilisation : gazole pour moteur diesel à allumage par compression (automobiles, poids lourds, bateaux, etc.), fioul léger pour le chauffage des locaux industriels et commerciaux, et autres gazoles, y compris les huiles lourdes distillant entre 380°C et 540°C utilisées comme produit d'alimentation dans l'industrie pétrochimique. Les gazoles/carburants diesel ne recouvrent pas le biocarburant liquide mélangé à du gazole/carburant diesel – voir biomasse liquide. Cette présentation n'est pas la même que celle figurant dans la publication *Données sur le pétrole*.

Fioul lourd (résiduel)

Ce produit englobe, par définition, les huiles lourdes constituant le résidu de distillation et tous les fiouls résiduels, y compris ceux obtenus par mélange. La viscosité cinétique est supérieure à 10 cSt à 80°C. Le point d'éclair est toujours supérieur à 50°C, et la densité est toujours supérieure à 0,9 kg/l.

Naphtas

Les naphtas sont un produit d'alimentation destiné soit à l'industrie pétrochimique (par exemple, fabrication d'éthylène ou production de composés aromatiques) soit à la production d'essence par reformage ou isomérisation dans la raffinerie. Les naphtas correspondent aux fractions distillant entre 30°C et 210°C. Les naphtas importés pour mélange doivent être indiqués dans les importations, puis repris à la ligne transferts, affectés d'un signe négatif pour les naphtas, et d'un signe positif pour les produits finis correspondants (par exemple, essence).

Coke de pétrole

Le coke de pétrole est, par définition, un résidu solide noir, obtenu principalement par craquage et carbonisation de produits d'alimentation dérivés du pétrole, de produits de la distillation sous vide du pétrole brut, de goudrons et de poix, dans des procédés tels que la cokéfaction différée ou la cokéfaction fluide. Il se compose essentiellement de carbone (90 à 95 %) et brûle en laissant peu de cendres. Il est employé comme produit d'alimentation dans les cokeries des usines sidérurgiques, pour la chauffe, pour la fabrication d'électrodes et pour la production de substances chimiques. Les deux qualités les plus importantes de coke sont le « coke brut » et le « coke calciné ». Cette catégorie comprend également le coke de catalyse, qui se dépose sur le catalyseur pendant les opérations de raffinage ; ce coke n'est pas récupérable, et il est en général brûlé comme combustible dans les raffineries.

Autres produits pétroliers

La catégorie *autres produits pétroliers* regroupe les white spirit et SBP, les lubrifiants, le bitume, les paraffines et d'autres produits.

Le white spirit et les essences spéciales (SBP) sont des distillats intermédiaires raffinés, dont l'intervalle de distillation se situe entre celui des naphtas et celui du kérosène. Le white spirit a un point d'éclair supérieur à 30°C et un intervalle de distillation compris entre 135°C et 200°C. Les essences spéciales (SBP) comprennent les huiles légères distillant entre 30°C et 200°C et dont l'écart de température entre les points de distillation de 5 % et 90 % en volume, y compris les pertes, est inférieur ou égal à 60°C. Autrement dit, il s'agit d'huiles légères dont la coupe est plus étroite que celle des essences moteur. On distingue sept ou huit qualités d'essences spéciales, selon la position de la coupe dans l'intervalle de distillation défini plus haut.

Les lubrifiants sont des hydrocarbures obtenus à partir de distillats ou de résidus ; ils sont principalement utilisés pour réduire les frottements entre surfaces

d'appui. Cette catégorie comprend tous les grades d'huiles lubrifiantes, depuis les spindles jusqu'aux huiles à cylindres, et les huiles entrant dans les graisses, y compris les huiles moteur et tous les grades d'huiles de base pour lubrifiants.

Le bitume est un hydrocarbure solide, semi-solide ou visqueux, à structure colloïdale, de couleur brune à noire. Il est issu de la distillation sous vide des huiles résiduelles de la distillation atmosphérique du pétrole brut. Le bitume est aussi souvent appelé asphalte, et il est principalement employé pour le revêtement des routes et pour les matériaux de toiture. Cette catégorie couvre le bitume fluidisé et le cutback.

Les paraffines sont des hydrocarbures aliphatiques saturés. Ce sont des résidus du déparaffinage des huiles lubrifiantes qui présentent une structure cristalline plus ou moins fine selon le grade. Elles ont pour principales caractéristiques d'être incolores, inodores et translucides, ainsi que d'avoir un point de fusion supérieur à 45°C.

Tous les produits pétroliers qui ne sont pas classés ci-dessus (par exemple, le goudron, le soufre et la graisse) entrent dans la catégorie des autres produits pétroliers. Cette catégorie comprend également les composés aromatiques (par exemple, BTX ou benzène, toluène et xylènes) et les oléfines (par exemple, propylène) produits dans les raffineries.

Gaz

Dans cette section, les quantités de gaz sont exprimées en térajoules, sur la base du **pouvoir calorifique supérieur**.

Gaz naturel

Le gaz naturel est constitué de gaz, méthane essentiellement, sous forme liquide ou gazeuse, extraits de gisements naturels souterrains. Il peut s'agir aussi bien de gaz « non associé » provenant de gisements qui produisent uniquement des hydrocarbures sous forme gazeuse, que de gaz « associé » obtenu en même temps que le pétrole brut, ou encore de méthane récupéré dans les mines de charbon (grisou) ou dans les veines de charbon (gaz de veines de charbon).

La production représente la quantité de gaz sec commercialisable à l'intérieur du territoire national, dont notamment la production au large des côtes, et elle est mesurée après élimination des impuretés et extraction des LGN et du soufre. En font partie le gaz consommé dans les installations de traitement du gaz et le gaz transporté par gazoduc. Les quantités de gaz réinjectées, rejetées dans l'atmosphère ou brûlées à la torche ne sont pas prises en compte.

Gaz d'usine à gaz

Cette catégorie couvre tous les types de gaz produits dans les usines des entreprises publiques ou privées ayant pour principal objet la production, le transport et la distribution de gaz. Cette catégorie comprend le gaz produit par carbonisation (y compris le gaz produit dans les fours à coke et transféré aux usines à gaz), par gazéification totale (avec ou sans enrichissement au moyen de produits pétroliers) ainsi que par reformage et simple mélange avec d'autres gaz et/ou de l'air.

Gaz de cokerie

Le gaz de cokerie est un sous-produit de la fabrication du coke de cokerie utilisé en sidérurgie.

Gaz de haut fourneau

Le gaz de haut fourneau est obtenu lors de la combustion du coke dans les hauts fourneaux de l'industrie sidérurgique. Il est récupéré et utilisé comme combustible, en partie dans l'usine même, et en partie pour d'autres procédés de l'industrie sidérurgique, ou encore dans des centrales électriques dotées d'équipements adaptés pour en brûler.

Le gaz de convertisseur à oxygène est obtenu comme sous-produit lors de l'élaboration de l'acier dans les fours à oxygène ou convertisseurs basiques avec soufflage d'oxygène ; il est récupéré à la sortie du gueulard. Il est également appelé gaz de convertisseur, gaz LD ou gaz BOS.

Énergies renouvelables combustibles et déchets

Les quantités de combustibles dans cette section sont exprimées en térajoules, sur la base du **pouvoir calorifique inférieur**, à l'exception de la biomasse liquide, dont les quantités concernées sont exprimées en milliers de tonnes.

Biomasse solide

La biomasse solide est, par définition, toute matière végétale utilisée directement comme combustible ou transformée avant de la brûler sous une autre forme.

Cette catégorie recouvre une multitude de matières ligneuses produites lors de processus industriels ou issues directement de la sylviculture et de l'agriculture (bois de chauffage, particules de bois, écorce, sciure, copeaux, lessives sulfitiques également appelées *liqueur noire*, matières/déchets d'origine animale et autres formes de biomasse solide).

Le charbon de bois produit à partir de la biomasse solide est également comptabilisé dans cette rubrique. Etant donné que le charbon de bois est un produit secondaire, son traitement est légèrement différent de celui de la biomasse primaire. La production de charbon de bois (un produit du processus de transformation) est compensée par les consommations correspondantes de biomasse primaire dans le processus de production. Les pertes lors de ce processus sont reportées dans la ligne *Secteur transformation - autres*. Les autres approvisionnements (correspondant par exemple aux échanges et aux variations de stocks) ainsi que la consommation de charbon de bois sont comptabilisés directement avec la biomasse primaire. Dans la plupart des pays, seule la biomasse primaire est indiquée.

Biogaz

Le biogaz, produit principalement par fermentation anaérobie de biomasse et de déchets solides, est brûlé pour produire de la chaleur et/ou de l'énergie électrique. Cette rubrique comprend les gaz de décharge, les gaz de digestion des boues et d'autres biogaz, notamment celui qui est issu de la fermentation anaérobie des lisiers et de déchets d'abattoirs, de brasseries et d'autres industries agroalimentaires.

Biomasse liquide

La catégorie de la biomasse liquide comprend les biocarburants liquides qui sont mélangés à l'essence et au gazole/carburant diesel ainsi qu'à d'autres biocarburants liquides. Elle ne correspond pas au volume total d'essence ou de diesel dans lesquels les biocarburants sont mélangés.

La bioessence comprend le bioéthanol (éthanol produit à partir de biomasse et/ou de la fraction biodégradable des déchets), le biométhanol (méthanol produit à partir de biomasse et/ou de la fraction biodégradable des déchets), le bio-ETBE (éthyl-tertio-butyl-éther produit à partir de bioéthanol : le pourcentage en volume de biocarburant dans le bio-ETBE est de 47 %) et le bioMTBE (méthyl-tertio-butyl-éther produit à partir de biométhanol : le pourcentage en volume de biocarburant dans le bioMTBE est de 36 %).

Les biodiesels comprennent le biodiesel (ester méthylique de qualité diesel produit à partir d'une huile végétale ou animale), le biodiméthyléther (diméthyléther produit à partir de la biomasse), le biocarburant filière Fischer-Tropsch (diesel de synthèse Fischer-Tropsch produit à partir de biomasse), les bio-huiles pressées à froid (huiles produites à partir d'oléagineux par un procédé exclusivement mécanique) et tous les autres biocarburants liquides qui sont utilisés par adjonction, mélange ou directement comme carburant diesel pour les transports.

Les autres biocombustibles liquides recouvrent ceux qui sont utilisés directement comme combustible, et qui ne sont renseignés ni dans la catégorie bioessence ni dans la catégorie biodiesels.

Déchets et autres non-spécifiés

Les déchets urbains correspondent aux produits brûlés directement pour produire de la chaleur et/ou de l'énergie électrique, dont notamment les déchets produits par les ménages, l'industrie, les hôpitaux et le secteur tertiaire, qui sont recueillis par les autorités municipales pour leur incinération dans des installations spécifiques.

Les déchets industriels d'origine non renouvelable concernent les produits liquides et solides (des pneus, par exemple) brûlés directement, généralement dans des installations spécialisées, pour produire de la chaleur et/ou de l'énergie électrique. Les déchets industriels renouvelables ne sont pas comptabilisés dans cette rubrique, mais avec la biomasse solide, le biogaz ou la biomasse liquide.

Électricité et chaleur

Les données sur l'électricité sont exprimées en gigawattheures et celles sur la chaleur en térajoules.

Électricité

La production brute d'électricité est mesurée aux bornes de tous les groupes d'alternateurs d'une centrale. Elle comprend donc l'énergie absorbée par les équipements auxiliaires et les pertes dans les transformateurs qui sont considérés comme faisant partie intégrante de la centrale.

La différence entre production nette et brute est généralement estimée à 7 % dans les centrales thermiques classiques, à 1 % dans les centrales hydroélectriques et à 6 % dans les centrales nucléaires, géothermiques

ou solaires. La production hydroélectrique comprend celle des centrales à accumulation par pompage (également appelées centrales de pompage).

Chaleur

La production de chaleur tient compte de toute la chaleur produite dans des centrales de cogénération ayant comme activité principale la production d'électricité et de chaleur et dans des centrales calogènes dont la production de chaleur est également l'activité principale, ainsi que de la chaleur vendue à des tiers par les centrales de cogénération chaleur/électricité et calogènes des autoproducteurs.

Les combustibles utilisés pour produire la chaleur destinée à la vente sont comptabilisés dans le secteur transformation, aux lignes *installations de cogénération* et *centrales calogènes*. Les quantités de combustibles utilisées pour produire la chaleur qui n'est pas vendue sont prises en compte dans les secteurs où cette consommation a lieu.

Hydroélectricité

L'hydroélectricité représente l'énergie potentielle et cinétique des eaux transformée en électricité dans les centrales hydroélectriques.

Énergie géothermique

L'énergie géothermique est l'énergie thermique disponible émise de l'intérieur de l'écorce terrestre, généralement sous forme d'eau chaude ou de vapeur. Elle est exploitée dans les sites qui s'y prêtent :

- pour la production d'électricité en mettant à profit la vapeur sèche ou la saumure naturelle de haute enthalpie après vaporisation instantanée
- directement sous forme de chaleur pour le chauffage urbain, l'agriculture, etc.

Énergie solaire

L'énergie solaire est le rayonnement solaire exploité pour la production d'eau chaude et d'électricité, au moyen de :

- capteurs plans, qui fonctionnent essentiellement en thermosiphon, pour la production d'eau chaude sanitaire ou pour le chauffage saisonnier des piscines
- cellules photovoltaïques
- centrales solaires thermiques

L'énergie solaire passive pour le chauffage, la climatisation et l'éclairage directs des logements ou autres bâtiments n'est pas prise en compte.

Énergies des marées/vagues/courants marins

Il s'agit de l'énergie mécanique résultant du mouvement des marées, des vagues ou des courants marins des océans exploitée pour la production d'électricité.

Énergie éolienne

L'énergie éolienne représente l'énergie cinétique du vent exploitée pour la production d'électricité au moyen d'aérogénérateurs.

4. NOTES CONCERNANT LES TABLEAUX RECAPITULATIFS

Production de charbon de bois

Le charbon de bois est un produit secondaire de la biomasse, qui se compose principalement de carbone, issue de la combustion lente et incomplète du bois ou d'autres produits végétaux en l'absence d'air. On notera que dans les tableaux annuels, le charbon de bois est inclus dans la biomasse solide (voir partie I.3, Notes concernant les sources d'énergie,).

Consommation d'électricité

Comprend l'utilisation de l'électricité dans les secteurs de transformation, d'énergie et de consommation finale, mais ne comprend pas les pertes de distribution.

Demande de produits raffinés par groupes principaux

La demande de produits raffinés par groupes principaux est définie comme la somme de l'approvisionnement intérieur, des transferts et des écarts statistiques moins les entrées dans les raffineries, les industries pétrochimique et de liquéfaction du secteur transformation, et la consommation propre du secteur énergie. *L'essence moteur* comprend les additifs et les liquides tirés de la biomasse. Les *autres produits* comprennent le pétrole brut, les autres hydrocarbures, le gaz de raffinerie, le coke de pétrole, le white spirit et les essences spéciales, les lubrifiants, le bitume, les paraffines et les autres produits tels que le goudron, le soufre, la graisse ainsi que les composés aromatiques (par exemple, BTX ou benzène, toluène et xylène) et les oléfines (par exemple, propylène) produits dans les raffineries.

Combustibles de raffinerie indique la consommation propre de combustibles pétroliers par les raffineries pour les opérations d'équipement, de chauffage et d'éclairage, qui comprennent principalement des gaz de raffinerie, du gazole-carburant diesel et du fioul lourd.

Les *soutes maritimes internationales* comprennent principalement du gazole-carburant diesel et du fioul lourd. Les tableaux de demande de produits raffinés par groupes principaux exceptionnellement incluent les *soutes aériennes internationales* dans la demande par pays.

Les coefficients de conversion suivants sont valables en général pour tous les pays et pour toutes les années.

Coefficients de conversion	
Produits pétroliers	**barils/tonne**
Gaz de raffinerie	8.00
Ethane	16.85
GPL	11.60
Naphta	8.50 (8.90 OCDE Europe)
Essence aviation	8.90
Essence moteur	8.53 (8.45 OCDE Europe)
Carburéacteur type essence	7.93 (8.25 OCDE)
Carburéacteur type kérosène	7.93 (7.88 OCDE Europe)
Autre kérosène	7.74 (7.88 OCDE Europe)
Gazole/carburant diesel	7.46
Fioul lourd	6.66 (6.45 OCDE Europe)
White spirit	7.00 (8.46 OCDE)
Lubrifiants	7.09
Bitume	6.08
Paraffines	7.00 (7.85 OCDE)
Coke de pétrole	5.50
Autres produits non spécifiés	7.00 (8.00 OCDE)

5. COUVERTURE GEOGRAPHIQUE

L'Afrique comprend l'Afrique du Sud, l'Algérie, l'Angola, le Bénin, le Botswana (depuis 1981), le Cameroun, le Congo, la République démocratique du Congo, la Côte d'Ivoire, l'Egypte, l'Erythrée, l'Ethiopie, le Gabon, le Ghana, le Kenya, la Jamahiriya arabe libyenne, le Maroc, le Mozambique, la Namibie (depuis 1991), le Nigéria, le Sénégal, le Soudan, la République unie de Tanzanie, le Togo, la Tunisie, la Zambie, le Zimbabwe et les **autres pays d'Afrique.**

Les autres pays d'Afrique comprennent le Botswana (jusqu'en 1980), le Burkina Faso, le Burundi, le Cap-Vert, la République centrafricaine, les Comores, Djibouti, la Gambie, la Guinée, la Guinée-Bissau, la Guinée équatoriale, le Lesotho, le Libéria, Madagascar, le Malawi, le Mali, la Mauritanie, Maurice, la Namibie (jusqu'en 1990), le Niger, l'Ouganda, la Réunion, le Rwanda, Sao Tomé-et-Principe, les Seychelles, la Sierra Leone, la Somalie, le Swaziland et le Tchad.

Le Moyen-Orient comprend l'Arabie saoudite, Bahreïn, les Emirats arabes unis, la République islamique d'Iran, l'Iraq, Israël, la Jordanie, le Koweït, le Liban, Oman, le Qatar, la République arabe syrienne et le Yémen.

La région Europe hors OCDE comprend l'Albanie, la Bosnie-Herzégovine, la Bulgarie, Chypre[1], la Croatie, Gibraltar, l'ex-République yougoslave de Macédoine (FYROM), Malte, la Roumanie, la Serbie[2] et la Slovénie.

L'ex-Union Soviétique comprend l'Arménie, l'Azerbaïdjan, la Biélorussie, l'Estonie, la Géorgie, le Kazakhstan, le Kirghizistan, la Lettonie, la Lituanie, la République de Moldavie, l'Ouzbékistan, la Fédération de Russie, le Tadjikistan, le Turkménistan et l'Ukraine.

L'Amérique latine comprend les Antilles néerlandaises, l'Argentine, la Bolivie, le Brésil, le Chili, la Colombie, le Costa Rica, Cuba, la République dominicaine, El Salvador, l'Equateur, le Guatemala, Haïti, le Honduras, la Jamaïque, le Nicaragua, Panama, le Paraguay, le Pérou, Trinité-et-Tobago, l'Uruguay, le Venezuela et les **autres pays d'Amérique latine.**

Les autres pays d'Amérique latine comprennent Antigua-et-Barbuda, Aruba, les Bahamas, la Barbade, le Belize, les Bermudes, la Dominique, la Grenade, la Guadeloupe, la Guyane, la Guyane française, les Iles Vierges Britanniques, les Iles Caïmans, les Iles Malouines, les Iles Turques et Caïques, la Martinique, Montserrat, Porto-Rico[3] (pour le gaz naturel), Saint-Kitts et Nevis, Sainte-Lucie, Saint-Pierre et Miquelon, Saint-Vincent et les Grenadines et le Suriname.

La Chine comprend la République populaire de Chine et Hong Kong (Chine).

L'Asie comprend le Bangladesh, Brunei Darussalam, le Cambodge (depuis 1995), la République populaire démocratique de Corée, l'Inde, l'Indonésie, la Malaisie, la Mongolie (depuis 1985), Myanmar, le Népal, le Pakistan, les Philippines, Singapour, Sri Lanka, le Taipei chinois, la Thaïlande, le Viet Nam et les **autres pays d'Asie**.

Les autres pays d'Asie comprennent l'Afghanistan, le Bhoutan, le Cambodge (jusqu'en 1994), les Fidji, les Iles Cook, Kiribati, le Laos, Macao, les Maldives, la Mongolie (jusqu'en 1984), la Nouvelle-Calédonie,

1. Se référer à la note sur Chypre dans la partie I.6, *Country notes and sources.*

2. La Serbie inclut le Monténégro jusqu'en 2004 et le Kosovo jusqu'en 1999.

3. Les statistiques sur le pétrole et sur les échanges de charbon de Porto-Rico sont incluses dans les Etats-Unis.

la Papouasie-Nouvelle-Guinée, la Polynésie française, le Samoa, les Iles Salomon, Timor Oriental, Tonga et Vanuatu.

L'Organisation de coopération et de développement économiques (OCDE) comprend l'Allemagne, l'Australie, l'Autriche, la Belgique, le Canada, la Corée, le Danemark, l'Espagne, les Etats-Unis, la Finlande, la France, la Grèce, la Hongrie, l'Irlande, l'Islande, l'Italie, le Japon, le Luxembourg, le Mexique, la Norvège, la Nouvelle-Zélande, les Pays-Bas, la Pologne, le Portugal, le Royaume-Uni, la République slovaque, la Suède, la Suisse, la République tchèque et la Turquie.

L'**Union européenne - 27 (UE-27)** comprend l'Allemagne, l'Autriche, la Belgique, la Bulgarie, Chypre[1], le Danemark, l'Espagne, l'Estonie, la Finlande, la France, la Grèce, la Hongrie, l'Irlande, l'Italie, la Lettonie, la Lituanie, le Luxembourg, Malte, les Pays-Bas, la Pologne, le Portugal, la Roumanie, le Royaume-Uni, la République slovaque, la Slovénie, la Suède, la République tchèque. Veuillez prendre note que dans le but de pouvoir comparer les données, tous ces pays sont inclus au sein de l'Union Européenne depuis 1990 quelle que soit leur date d'adhésion à l'Union.

Dans la zone de l'OCDE :

- L'**Australie** ne comprend pas les territoires d'outre-mer ;
- L'**Allemagne** tient compte des nouveaux Länder à partir de 1970 ;
- Le Groenland et les Iles Féroé danoises ne sont pas pris en compte dans les données relatives au **Danemark**. Cependant, les données sur le pétrole du Groenland sont prises en compte dans les statistiques danoises avant 1990. L'administration danoise envisage de réviser les séries chronologiques en remontant jusqu'en 1974 afin d'en retirer ces quantités ;
- L'**Espagne** englobe les Iles Canaries ;
- Les **Etats-Unis** englobent les 50 Etats fédérés et le District de Columbia. Les statistiques sur le pétrole et sur les échanges de charbon concernent également Porto-Rico[4], l'Ile de Guam, les Iles Vierges des Etats-Unis, le Territoire non incorporé des Samoa américaines, l'Ile Johnston, les Iles Midway, l'Ile de Wake et les Iles Mariannes-du-Nord ;
- Dans les données relatives à la **France**, Monaco est pris en compte, mais pas les départements et territoires d'outre-mer (Guadeloupe, Guyane, Martinique, Nouvelle-Calédonie, Polynésie française, Ile de la Réunion et Saint-Pierre-et-Miquelon) ;
- L'**Italie** englobe Saint-Marin et le Vatican ;
- Le **Japon** englobe Okinawa ;
- Ni le Suriname ni les Antilles néerlandaises ne sont pris en compte dans les données relatives aux **Pays-Bas ;**
- Le **Portugal** englobe les Açores et l'Ile de Madère ;
- La **Suisse** englobe le Liechtenstein seulement pour les données de pétrole.

L'Organisation des pays exportateurs de pétrole (OPEP)[5] comprend l'Algérie, l'Angola, l'Arabie saoudite, l'Equateur, l'Iran, l'Iraq, le Koweït, la Jamahiriya arabe libyenne, le Nigéria, le Qatar, les Emirats arabes unis et le Venezuela.

On notera que les pays suivants n'ont pas été pris en compte par suite d'un manque de données :

- **Europe hors OCDE** : Liechtenstein[6] (sauf pour les statistiques sur le pétrole), Monténégro[7] (après 2004) ;
- **Afrique** : Sainte-Hélène et Sahara Occidental ;
- **Amérique** : Anguilla ;
- **Asie et Océanie** : Ile Christmas, Nauru, Nioué-et-Palaos.

4. Les statistiques sur le gaz naturel de Porto-Rico sont incluses dans les autres pays d'Amérique latine.
5. Les données de l'Indonésie, qui a quitté l'OPEP en 2009, ont été déduites de l'OPEP dans l'édition courante de cette publication.
6. Les statistiques sur le pétrole pour le Liechtenstein sont incluses dans la Suisse.
7. Les données du Monténégro sont incluses dans la Serbie jusqu'en 2004.

Liquid biomass is converted from kt to TJ using the corresponding net calorific values.

La biomasse liquide est convertie de kt en TJ en utilisant les PCI correspondants.

Production of primary energy from combustible renewables and waste (TJ)

Production d'énergie primaire à partir d'énergies renouvelables comb. et de déchets (TJ)

Erzeugung von primaren erneuerbaren Brennstoffen und Abfällen (TJ)

Produzione di energia primaria da combustibili rinnovabili e rifiuti (TJ)

可燃性再生可能一次エネルギー及び廃棄物の生産量 (TJ)

Producción de energia primaria a partir de combustibles renovables y residuos (TJ)

Производство первичной энергии из возобновляемых видов топлива и отходов (ТДж)

Starting with this edition, international aviation bunkers are no longer included in the transport sector at the country level. They are subtracted out of supply in the same way as international marine bunkers. Time series for countries' consumption may have significantly decreased compared to last year's edition.
Dorénavant les soutes aériennes internationales ne sont plus comprises dans le secteur des transports au niveau d'un pays mais sont déduites de l'approvisionnement. Les séries chronologiques de consommation des pays peuvent présenter des baisses significatives par rapport à l'édition précédente.

Final consumption of oil (1000 tonnes)

Consommation finale de pétrole (1000 tonnes)

Endverbrauch von Öl (1000 Tonnen)

Consumo finale di petrolio (1000 tonnellate)

石 油 の 最 終 消 費 量 （千トン）

Consumo final de petróleo (1000 toneladas)

Конечное потребление нефти и нефтепродуктов (тыс. т)

Includes non-energy use for this sector./ *Comprend l'usage non-énergétique pour ce secteur.*

Starting with this edition, international aviation bunkers are no longer included in the transport sector at the country level. They are subtracted out of supply in the same way as international marine bunkers. Time series for countries' consumption may have significantly decreased compared to last year's edition.

Consumption of oil in transport (1000 tonnes)

Consommation de pétrole dans les transports (1000 tonnes)

Ölverbrauch im Verkehrssektor (1000 Tonnen)

Consumo di petrolio nel settore dei trasporti (1000 tonnellate)

運輸部門における石油の消費量（千トン）

Consumo de petróleo en el transporte (1000 toneladas)

Потребление нефти и нефтепродуктов в транспорте (тыс. т)

MULTILINGUAL GLOSSARIES

English	Français	Deutsch
coking coal	charbon à coke	Kokskohle
other bituminous coal	autres charbons bitumineux	Sonstige bituminöse Kohle
anthracite	anthracite	Anthrazit
sub-bituminous coal	charbons sous-bitumineux	Sub-bituminöse Kohle
lignite	lignite	Braunkohle
peat	tourbe	Torf
coke oven coke	coke de four à coke	Koks
gas coke	coke d'usine à gaz	Gas-Kohle
patent fuel	agglomérés	Steinkohlenbriketts
brown coal/peat briquettes (BKB)	briquettes de lignite et de tourbe	Braunkohlenbriketts
crude oil	pétrole brut	Rohöl
natural gas liquids (NGL)	liquides de gaz naturel (LGN)	Kondensate
refinery feedstocks	prod. d'alimentation des raffineries	Wiedereinsatzprodukte
additives	additifs	Additive
refinery gas	gaz de raffinerie	Raffineriegase
liquefied petroleum gases (LPG)	gaz de pétrole liquéfiés (GPL)	Flüssiggase (LPG)
ethane	éthane	Äthan
motor gasoline	essence moteur	Otto-Kraftstoff
aviation fuel	carburant aviation	Luftfahrtkraftstoff
kerosene	kérosène	Kerosin
gas/diesel oil	gazole/carburant diesel	Dieselkraftstoff/Heizöl
heavy fuel oil	fioul lourd	Schweres Heizöl
naphtha	naphtas	Naphtha
petroleum coke	coke de pétrole	Petrolkoks
white spirit and industrial spirit	white spirit et essences spéciales	Spezialbenzin/Testbenzin
lubricants	lubrifiants	Schmiermittel
bitumen	bitume	Bitumen
paraffin waxes	paraffines	Paraffine
natural gas	gaz naturel	Erdgas
gas works gas	gaz d'usine à gaz	Stadtgase
coke oven gas	gaz de cokerie	Kokereigase
blast furnace gas	gaz de haut fourneau	Hochofen-/Gichtgase
oxygen steel furnace gas	gaz de convertisseur	Stahl-Einblasgase
solid biomass	biomasse solide	Biomasse
liquid biomass	liquides tirés de la biomasse	Flüssige Biomasse
biogas	biogaz	Biogase
municipal waste	déchets urbains	Städtische Abfälle
industrial waste	déchets industriels	Industrieabfälle
electricity	électricité	Elektrizität
heat	chaleur	Wärme
nuclear power	électricité d'origine nucléaire	Kernkraft
hydro power	hydroélectricité	Wasserkraft
geothermal energy	énergie géothermique	Geothermische Energie
solar energy	énergie solaire	Sonnenenergie
tide/wave/ocean energy	énergie des marées/vagues/courants marins	Gezeiten- und Wellenkraft
wind energy	énergie éolienne	Windenergie

	Français	Deutsch
1	Production	Produktion
2	Autres sources	Andere Quellen
3	Importations	Importe
4	Exportations	Exporte
5	Soutes maritimes internationales	Bunkerbestände der internationalen Seeschifffahrt
6	Soutes aériennes internationales	Bunkerbestände der internationalen Luftfahrt
7	Variations des stocks	Bestandsveränderungen
8	**APPROVISIONNEMENT INTERIEUR**	**INLANDSVERSORGUNG**
9	Transferts	Transfer
10	Ecarts statistiques	Statistische Differenzen
11	**SECTEUR TRANSFORMATION**	**UMWANDLUNGSBEREICH**
12	Centrales électriques	Elektrizitätswerke
13	Centrales de cogénération	Elektrizitäts- und Heizkraftwerke
14	Centrales calogènes	Heizkraftwerke
15	Hauts fourneaux et usines à gaz	Hochofen und Gaswerke
16	Cokeries/usines d'agglomérés/usines de briquettes de lignite	Koks- und Brikettfabriken
17	Raffineries de pétrole	Raffinerien
18	Industrie pétrochimique	Petrochemische Industrie
19	Unités de liquéfaction	Verflüssigung
20	Secteur transformation - autres	Sonstige im Umwandlungsbereich
21	**SECTEUR ENERGIE**	**ENERGIESEKTOR**
22	Mines de charbon et extraction de pétrole et de gaz	Kohlenbergwerke, Erdöl- und Erdgasgewinnung
23	Raffineries de pétrole	Raffinerien
24	Centrales électriques, centrales de cogénération et centrales calogènes	Wärmekraftwerke
25	Accumulation par pompage (électricité)	Pumpspeicherwerke
26	Secteur énergie - autres	Sonstige Energiesektoren
27	Pertes de distribution	Verteilungsverluste
28	**CONSOMMATION FINALE**	**ENDENERGIEVERBRAUCH**
29	**SECTEUR INDUSTRIE**	**INDUSTRIE**
30	Sidérurgie	Eisen- und Stahlindustrie
31	Industrie chimique et pétrochimique	Chemische Industrie
32	Métaux non ferreux	Ne-Metallerzeugung
33	Produits minéraux non métalliques	Glas- und Keramikindustrie
34	Matériel de transport	Fahrzeugbau
35	Construction mécanique	Maschinenbau
36	Industrie extractives	Bergbau und Steinbrüche

49	Non spécifiés	Sonstige
50	**AUTRES SECTEURS**	**ANDERE SEKTOREN**
51	Résidentiel	Wohungssektor
52	Commerce et services publics	Handel- und öffentliche Einrichtungen
53	Agriculture / sylviculture	Landwirtschaft / Forstwirtschaft
54	Pêche	Fischfang
55	Non spécifiés	Sonstige
56	**UTILISATIONS NON ENERGETIQUES**	**NICHTENERGETISCHER VERBRAUCH**
57	dans l'industrie/transformation/énergie	im Industrie-/Umwandlung-/Energiesektor
58	*dont : produits d'alimentation*	*davon: Feedstocks*
59	dans les transports	im Verkehr
60	dans les autres secteurs	im anderen Sektoren

English	Italiano	Japanese
coking coal	carbone siderurgico	原料炭
other bituminous coal	altro carbone bituminoso	その他歴青炭
anthracite	antracite	無煙炭
sub-bituminous coal	carbone sub - bituminoso	亜歴青炭
lignite	lignite	亜炭
peat	torba	泥炭
coke oven coke	coke d'altoforno	コークス
gas coke	coke di gassificazione	ガスコークス
patent fuel	agglomerati	専売燃料
brown coal/peat briquettes (BKB)	bricchette o formelle di lignite/torba	BKB
crude oil	petrolio greggio	原油
natural gas liquids (NGL)	liquidi di gas naturale – LGN	NGL
refinery feedstocks	materiali di base di raffineria	精油所原料油
additives	additivi	添加剤
refinery gas	gas di raffineria	製油ガス
liquefied petroleum gases (LPG)	gas di petrolio liquefatti	LPG
ethane	etano	エタン
motor gasoline	benzina	自動車ガソリン
aviation fuel	carburante aviazione	航空燃料
kerosene	cherosene	灯油
gas/diesel oil	gasolio	軽油／ディーゼルオイル
heavy fuel oil	olio combustibile pesante	重油
naphtha	nafta	ナフサ
petroleum coke	coke di petrolio	石油コークス
white spirit and industrial spirit	acqua ragia e alcool industriale	ホワイト／工業用スピリッツ
lubricants	lubrificanti	潤滑油
bitumen	bitume	ビチューメン
paraffin waxes	paraffine solide	パラフィン ワックス
natural gas	gas naturale	天然ガス
gas works gas	gas di officine del gas	ガス製造所ガス
coke oven gas	gas di cokeria	コークス炉ガス
blast furnace gas	gas d'altoforno	高炉ガス
oxygen steel furnace gas	gas d'altoforno	転炉ガス
solid biomass	biomassa solida	バイオマス（固形）
liquid biomass	biomassa liquida	バイオマス(液体)
biogas	biogas	バイオガス
municipal waste	rifiuti urbani	都市廃棄物
industrial waste	rifiuti industriali	産業廃棄物
electricity	energia elettrica	電力
heat	calore	熱
nuclear power	energia nucleare	原子力
hydro power	energia idroelettrica	水力
geothermal energy	energia geotermica	地熱
solar energy	energia solare	太陽光
tide/wave/ocean energy	en.maremotr./da moto ondoso/ocean.	潮力・波力・海洋エネルギー
wind energy	energia eolica	風力

	Italiano	Japanese
1	Produzione	生産
2	Altre fonti	受入
3	Importazioni	輸入
4	Esportazioni	輸出
5	Bunkeraggi marittimi internazionali	国際海運バンカー
6	Bunkeraggi aerei internazionali	国際航空バンカー
7	Variazioni di stock	在庫変動
8	**CONSUMO INTERNO LORDO**	**国内供給計**
9	Trasferimenti	変換
10	Differenza statistica	統計誤差
11	**SETTORE DELLA TRASFORMAZIONE**	**転換部門**
12	Centrali elettriche	電気事業者・自家発
13	Impianti di cogenerazione	コージェネレーション
14	Impianti di produzione di calore	熱供給事業者
15	Altiforni/officine del gas	高炉ガス・都市ガス
16	Cokerie/fabbriche di agglomerati e bricchette o formelle di lignite	コークス・練豆炭
17	Raffinerie di petrolio	石油精製
18	Industria petrochimica	石油化学
19	Liquefazione	液化

56	**USI NON ENERGETICI**	**非エネルギー**
57	dell'industria	産業・変換・エネルギー部門
58	*di cui: prodotti intermedi*	*（含原料油・半製品）*
59	dei trasporti	運輸部門
60	degli altri settori	他の部門

English	Español	Русский
coking coal	carbón coquizable	коксующийся уголь
other bituminous coal	otros carbónes bituminosos	проч. битуминоз. угли/антрацит
anthracite	antracita	антрацит
sub-bituminous coal	carbón sub-bituminoso	полубитуминозные угли
lignite	lignito	лигнит
peat	turba	торф
coke oven coke	coque de coquerías	доменный кокс
gas coke	gas de coque	газовый кокс
patent fuel	aglomerado de hulla	каменно-угольные брикеты
brown coal/peat briquettes (BKB)	carbón café/briquetas de turba	буроугольные/торфяные брикеты
crude oil	petróleo crudo	сырая нефть
natural gas liquids (NGL)	líquidos de gas natural	газовые конденсаты
refinery feedstocks	materia prima para refinerías	нефтезаводское сырье
additives	aditivos	присадки и оксигенаты
refinery gas	gas de refinerías	газы нефтепереработки
liquefied petroleum gases (LPG)	gas licuado de petróleo (GLP)	сжиженные нефтяные газы
ethane	etano	этан
motor gasoline	gasolinas para automotores	автомобильный бензин
aviation fuel	combustible de aviación	авиационное топливо
kerosene	queroseno	керосин
gas/diesel oil	gasóleo/diesel	газойль/дизельное топливо
heavy fuel oil	combustóleo pesado	мазутное топливо
naphtha	nafta	нафта
petroleum coke	coque de petróleo	нефтяной кокс
white spirit and industrial spirit	disolventes	уайт-спирит
lubricants	lubrificantes	смазочные масла
bitumen	asfalto (betún)	битум

Energy Data Manager / Statistician

Possible Staff Vacancies

International Energy Agency, Paris, France

The IEA

The International Energy Agency, based in Paris, acts as energy policy advisor to 28 member countries in their effort to ensure reliable, affordable and clean energy for their citizens. Founded during the oil crisis of 1973-74, the IEA's initial role was to co-ordinate measures in times of oil supply emergencies. As energy markets have changed, so has the IEA. Its mandate has broadened to incorporate the "Three E's" of balanced energy policy making: energy security, economic development and environmental protection. Current work focuses on climate change policies, market reform, energy technology collaboration and outreach to the rest of the world, especially major consumers and producers of energy like China, India, the Russian Federation and the OPEC countries.

The Energy Statistics Division, with a staff of around 30 people, provides a dynamic environment for young people just finishing their studies or with one to two years of work experience.

Job description

The data managers/statisticians compile, verify and disseminate information on all aspects of energy including production, transformation and consumption of all fuels, renewables, the emergency reporting system, energy efficiency indicators, CO_2 emissions, and energy prices and taxes. The data managers are responsible for receiving, reviewing and inputting data submissions from Member countries and other sources into large computerised databases. They check for completeness, correct calculations, internal consistency, accuracy and consistency with definitions. Often this entails proactively investigating and helping to resolve anomalies in collaboration with national administrations of Member and non-Member countries. The data managers/statisticians also play a key role in helping to design and implement computer macros used in the preparation of their energy statistics publication(s).

Principal Qualifications

- University degree in a topic relevant to energy, computer programming or statistics. We currently have staff with degrees in Mathematics, Statistics, Information Technology, Economics, Engineering, Physics, Chemistry, Environmental Studies, Hydrology, Public Administration and Business.
- Experience in the basic use of databases and computer software. Good computer programming skills in Visual Basic.
- Ability to work accurately, pay attention to detail and work to deadlines. Ability to deal simultaneously with a wide variety of tasks and to organise work efficiently.
- Good communication skills; ability to work well in a team and in a multicultural environment, particularly in liaising with contacts in national administrations and industry.
- Very good knowledge of one of the two official languages of the Organisation (English or French). Knowledge of other languages would be an advantage.
- Some knowledge of energy industry operations and terminology would also be an advantage, but is not required.

Nationals of any OECD Member country are eligible for appointment. Basic salaries range from 2 900 to 3 900 Euros per month, depending on qualifications. The possibilities for advancement are good for candidates with appropriate qualifications and experience. Tentative enquiries about future vacancies are welcomed from men and women with relevant qualifications and experience. Applications in French or English, accompanied by a curriculum vitae, should be sent to:

Personnel and Finance Division
International Energy Agency
9 rue de la Fédération
75739 Paris Cedex 15, France
Email: recruitment@iea.org

Gestionnaire de données sur l'énergie / Statisticien

Vacances d'emploi éventuelles

Agence internationale de l'énergie, Paris, France

L'AIE

L'Agence internationale de l'énergie, établie à Paris, dispense des conseils de politique énergétique à ses 28 pays membres qui s'emploient à assurer pour leurs citoyens des approvisionnements en énergie fiables, propres et à des prix abordables. Créée pendant la crise pétrolière de 1973-74, l'AIE avait pour mission dans un premier temps de coordonner les mesures à prendre en temps de crise des approvisionnements pétroliers. Au fur et à mesure que les marchés de l'énergie évoluaient, l'AIE a elle aussi changé. Son mandat s'est élargi pour prendre en considération les « trois E » qui sont à la base d'une élaboration équilibrée des politiques énergétiques : la sécurité énergétique, le développement économique et la protection de l'environnement. Les travaux actuels de l'Agence sont axés sur les politiques climatiques, la réforme des marchés, la coopération en matière de technologie de l'énergie et les relations avec le reste du monde, notamment avec de grands producteurs et consommateurs d'énergie tels la Chine, l'Inde, la Fédération de Russie et les pays de l'OPEP.

La Division des statistiques de l'énergie, qui compte quelque 30 personnes, offre un environnement dynamique pour de jeunes diplômés de fraîche date ou possédant une ou deux années d'expérience professionnelle.

Description de poste

Les gestionnaires de données/statisticiens compilent, vérifient et diffusent des informations sur tous les aspects de l'énergie, notamment la production, la transformation et la consommation de tous les combustibles, les énergies renouvelables, le système de notification des situations d'urgence, les indicateurs d'efficacité énergétique, les émissions de CO_2, ainsi que les prix et la fiscalité de l'énergie. Les gestionnaires de données sont chargés de recevoir, contrôler et introduire dans des bases de données informatisées de taille importante les données communiquées par les pays membres et d'autres sources. Ils en vérifient l'exhaustivité, corrigent les calculs, et s'assurent de la cohérence interne, de l'exactitude et de l'homogénéité de ces données par rapport aux définitions. A cet effet, ils sont souvent amenés à entreprendre activement des recherches, et à aider à résoudre les anomalies en concertation avec les administrations nationales des pays membres et non membres. Les gestionnaires de données/statisticiens jouent également un rôle essentiel en contribuant à la conception et à l'exécution des macros utilisées pour préparer leur(s) publication(s) de statistiques énergétiques.

Principales qualifications

- Diplôme universitaire dans un domaine se rapportant à l'énergie, aux langages de programmation ou à la statistique. Nous comptons actuellement dans nos effectifs des diplômés en mathématiques, statistiques, technologies de l'information, économie, sciences de l'ingénieur, physique, chimie, sciences de l'environnement, hydrologie, administration publique et études commerciales.
- Notions pratiques de l'utilisation de bases de données et de logiciels. Bonnes compétences en programmation en langage Visual Basic.
- Aptitude à travailler avec précision et sens de la minutie, ainsi qu'à respecter les délais. Aptitude à traiter simultanément des tâches variées et à s'organiser avec efficacité.
- Bonne capacité de communication ; esprit d'équipe avéré et aptitude à travailler dans un environnement pluriculturel, notamment en assurant la liaison avec les contacts dans les administrations nationales et dans l'industrie.
- Très bonne connaissance de l'une des deux langues officielles de l'Organisation (anglais ou français). La connaissance d'autres langues constituerait un avantage.
- Une certaine connaissance des activités de l'industrie de l'énergie et de la terminologie correspondante serait également un atout, mais n'est pas indispensable.

Ces postes sont ouverts aux ressortissants des pays membres de l'OCDE. Les traitements de base sont compris entre 2 900 et 3 900 euros par mois, suivant les qualifications. Les candidats possédant les qualifications et l'expérience appropriées se verront offrir des perspectives de promotion. Les demandes de renseignements sur les postes susceptibles de se libérer qui émanent de personnes dotées des qualifications et de l'expérience voulues seront les bienvenues. Les candidatures, rédigées en français ou en anglais et accompagnées d'un curriculum vitae, doivent être envoyées à l'adresse suivante :

Division du personnel et des finances
Agence internationale de l'énergie
9 rue de la Fédération
75739 Paris Cedex 15, France

On-Line Data Services

Users can instantly access not only all the data published in this book, but also all the time series used for preparing this publication and all the other statistics publications of the IEA. The data are available on-line, either through annual subscription or pay-per-view access. More information on this service can be found on our website: http://data.iea.org

Ten Annual Publications

Energy Statistics of OECD Countries, 2009 Edition

No other publication offers such in-depth statistical coverage. It is intended for anyone involved in analytical or policy work related to energy issues. It contains data on energy supply and consumption in original units for coal, oil, natural gas, combustible renewables/wastes and products derived from these primary fuels, as well as for electricity and heat. Complete data are available for 2006 and 2007 and supply estimates are available for the most recent year (*i.e.* 2008). Historical tables summarise data on production, trade and final consumption. Each issue includes definitions of products and flows and explanatory notes on the individual country data.

Published July 2009 - Price €120

Energy Balances of OECD Countries, 2009 Edition

A companion volume to *Energy Statistics of OECD Countries*, this publication presents standardised energy balances expressed in million tonnes of oil equivalent. Energy supply and consumption data are divided by main fuel: coal, oil, gas, nuclear, hydro, geothermal/solar, combustible renewables/wastes, electricity and heat. This allows for easy comparison of the contributions each fuel makes to the economy and their interrelationships through the conversion of one fuel to another. All of this is essential for estimating total energy supply, forecasting, energy conservation, and analysing the potential for interfuel substitution. Complete data are available for 2006 and 2007 and supply estimates are available for the most recent year (*i.e.* 2008). Historical tables summarise key energy and economic indicators as well as data on production, trade and final consumption. Each issue includes definitions of products and flows and explanatory notes on the individual country data as well as conversion factors from original units to tonnes of oil equivalent.

Published July 2009 - Price €120

Energy Statistics of Non-OECD Countries, 2009 Edition

This publication offers the same in-depth statistical coverage as the homonymous publication covering OECD countries. It includes data in original units for more than 100 individual countries and nine main regions. The consistency of OECD and non-OECD countries' detailed statistics provides an accurate picture of the global energy situation for 2006 and 2007. For a description of the content, please see *Energy Statistics of OECD Countries* above.

Published August 2009 - Price €120

Energy Balances of Non-OECD Countries, 2009 Edition

A companion volume to the publication *Energy Statistics of Non-OECD Countries*, this publication presents energy balances in million tonnes of oil equivalent and key economic and energy indicators for more than 100 individual countries and nine main regions. It offers the same statistical coverage as the homonymous publication covering OECD countries, and thus provides an accurate picture of the global energy situation for 2006 and 2007. For a description of the content, please see *Energy Balances of OECD Countries* above.

Published August 2009 - Price €120

Electricity Information 2009

This reference document provides essential statistics on electricity and heat for each OECD member country by bringing together information on production, installed capacity, input energy mix to electricity and heat production, input fuel prices, consumption, end-user electricity prices and electricity trades. The document also presents selected non-OECD country statistics on the main electricity and heat flows. It is an essential document for electricity and heat market and policy analysts.

Published August 2009 - Price €150

Coal Information 2009

This well-established publication provides detailed information on past and current evolution of the world coal market. It presents country-specific statistics for OECD member countries and selected non-OECD countries on coal production, demand, trade and prices. This publication represents a key reference tool for all those involved in the coal supply or consumption stream, as well as institutions and governments involved in market and policy analysis of the world coal market.

Published August 2009 - Price €165

Natural Gas Information 2009

A detailed reference work on gas supply and demand, covering not only the OECD countries but also the rest of the world. Contains essential information on LNG and pipeline trade, gas reserves, storage capacity and prices. The main part of the book, however, concentrates on OECD countries, showing a detailed gas supply and demand balance for each individual country and for the three OECD regions: North America, Europe and Asia-Pacific, as well as a breakdown of gas consumption by end-user. Import and export data are reported by source and destination.

Published August 2009 - Price €165

Oil Information 2009

A comprehensive reference book on current developments in oil supply and demand. The first part of this publication contains key data on world production, trade, prices and consumption of major oil product groups, with time series back to the early 1970s. The second part gives a more detailed and comprehensive picture of oil supply, demand, trade, production and consumption by end-user for each OECD country individually and for the OECD regions. Trade data are reported extensively by origin and destination.

Published August 2009 - Price €165

Renewables Information 2009

This reference document brings together in one volume essential statistics on renewables and waste energy sources. It presents a detailed and comprehensive picture of developments for renewable and waste energy sources for each of the OECD member countries, encompassing energy indicators, generating capacity, electricity and heat production from renewable and waste sources, as well as production and consumption of renewable and waste products. It also includes a selection of indicators for non-OECD countries. This report provides a strong foundation for renewables energy policy and market analysis to assess progress towards domestic and international objectives.

Published August 2009 - Price €110

CO_2 Emissions from Fuel Combustion, 2009 Edition

In order for nations to tackle the problem of climate change, they need accurate greenhouse gas emissions data. This publication provides a basis for comparative analysis of CO_2 emissions from fossil fuel combustion, a major source of anthropogenic emissions. The data in this book are designed to assist in understanding the evolution of the emissions of CO_2 from 1971 to 2007 for more than 140 countries and regions by sector and by fuel. Emissions were calculated using IEA energy databases and the default methods and emissions factors from the *Revised 1996 IPCC Guidelines for National Greenhouse Gas Inventories*.

Published November 2009 - Price €165

Two Quarterlies

Oil, Gas, Coal and Electricity, Quarterly Statistics

This publication provides up-to-date, detailed quarterly statistics on oil, coal, natural gas and electricity for the OECD countries. Oil statistics cover production, trade, refinery intake and output, stock changes and consumption for crude oil, NGL and nine selected oil product groups. Statistics for electricity, natural gas and coal show supply and trade. Import and export data are reported by origin and destination. Moreover, oil as well as hard coal and brown coal production are reported on a worldwide basis.

Published Quarterly - Price €120, annual subscription €380

Energy Prices and Taxes

This publication responds to the needs of the energy industry and OECD governments for up-to-date information on prices and taxes in national and international energy markets. It contains prices at all market levels for OECD countries and certain non-OECD countries: import prices, industry prices and consumer prices. The statistics cover the main petroleum products, gas, coal and electricity, giving for imported products an average price both for importing country and country of origin. Every issue includes full notes on sources and methods and a description of price mechanisms in each country.

Published Quarterly - Price €120, annual subscription €380

Electronic Editions

CD-ROMs and Online Data Services

To complement its publications, the Energy Statistics Division produces CD-ROMs containing the complete databases which are used for preparing the statistics publications. State-of-the-art software allows you to access and manipulate all these data in a very user-friendly manner and includes graphic facilities. These databases are also available on the internet from our online data service.

Annual CD-ROMS / Online Databases

- Energy Statistics of OECD Countries, 1960-2008 — Price: €550 (single user)
- Energy Balances of OECD Countries, 1960-2008 — Price: €550 (single user)
- Energy Statistics of Non-OECD Countries, 1971-2007 — Price: €550 (single user)
- Energy Balances of Non-OECD Countries, 1971-2007 — Price: €550 (single user)
- *Combined subscription of the above four series* — *Price: € 1 400 (single user)*

- Electricity Information 2009 — Price: €550 (single user)
- Coal Information 2009 — Price: €550 (single user)
- Natural Gas Information 2009 — Price: €550 (single user)
- Oil Information 2009 — Price: €550 (single user)
- Renewables Information 2009 — Price: €400 (single user)
- CO_2 Emissions from Fuel Combustion, 1971-2007 — Price: €550 (single user)

Quarterly CD-ROMs / Online Databases

- Energy Prices and Taxes — Price: (four quarters) €900 (single user)

A description of these services are available on our website: **http://data.iea.org**

Other Online Services

The Monthly Oil Data Service

The IEA Monthly Oil Data Service provides the detailed databases of historical and projected information which is used in preparing the IEA's monthly *Oil Market Report* (OMR). The IEA Monthly Oil Data Service comprises three packages available separately or combined as a subscriber service on the Internet. The data are available at the same time as the official release of the Oil Market Report.

The packages include:

- Supply, Demand, Balances and Stocks — Price: €6 000 (single user)
- Trade — Price: €2 000 (single user)
- Field-by-Field Supply — Price: €3 000 (single user)
- *Complete Service* — *Price: € 9 000 (single user)*

A description of this service is available on our website: **http://modsinfo.iea.org**

The Monthly Gas Data Service

The Monthly Gas Data Service provides for OECD countries historical and current data on natural gas supply and demand, as well as detailed information on trade origins and destinations.

The packages include:

- Natural Gas Balances & Trade
  Historical plus 12 monthly updates — Price: €500 (single user)
- Natural Gas Balances & Trade
  Historical — Price: €400 (single user)

A description of this service is available on our website: **http://data.iea.org**

Moreover, the IEA statistics website contains key energy indicators by country, graphs on the world and OECD's energy situation evolution from 1971 to the most recent year available, as well as selected databases for demonstration.

The IEA statistics website can be accessed at: http://www.iea.org/statistics/

The Online Bookshop

International Energy Agency

All IEA publications may be bought online on the IEA website:

www.iea.org/books

You may also obtain PDFs of all IEA books at 20% discount.

Books published before January 2008
- with the exception of the statistics publications -
can be downloaded in PDF, free of charge
from the IEA website.
