INTERNATIONAL ENERGY AGENCY

9, RUE DE LA FÉDÉRATION, 75739 PARIS CEDEX 15, FRANCE

The International Energy Agency (IEA) is an autonomous body which was established in November 1974 within the framework of the Organisation for Economic Co-operation and Development (OECD) to implement an international energy programme.

It carries out a comprehensive programme of energy co-operation among twenty-six* of the OECD's thirty Member countries. The basic aims of the IEA are:

- To maintain and improve systems for coping with oil supply disruptions;
- To promote rational energy policies in a global context through co-operative relations with non-member countries, industry and international organisations;
- To operate a permanent information system on the international oil market;
- To improve the world's energy supply and demand structure by developing alternative energy sources and increasing the efficiency of energy use;
- To assist in the integration of environmental and energy policies.

**IEA Member countries: Australia, Austria, Belgium, Canada, the Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Japan, the Republic of Korea, Luxembourg, the Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States. The European Commission also takes part in the work of the IEA.*

ORGANISATION FOR ECONOMIC CO-OPERATION AND DEVELOPMENT

Pursuant to Article 1 of the Convention signed in Paris on 14th December 1960, and which came into force on 30th September 1961, the Organisation for Economic Co-operation and Development (OECD) shall promote policies designed:

- To achieve the highest sustainable economic growth and employment and a rising standard of living in Member countries, while maintaining financial stability, and thus to contribute to the development of the world economy;
- To contribute to sound economic expansion in Member as well as non-member countries in the process of economic development; and
- To contribute to the expansion of world trade on a multilateral, non-discriminatory basis in accordance with international obligations.

The original Member countries of the OECD are Austria, Belgium, Canada, Denmark, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, the United Kingdom and the United States. The following countries became Members subsequently through accession at the dates indicated hereafter: Japan (28th April 1964), Finland (28th January 1969), Australia (7th June 1971), New Zealand (29th May 1973), Mexico (18th May 1994), the Czech Republic (21st December 1995), Hungary (7th May 1996), Poland (22nd November 1996), the Republic of Korea (12th December 1996) and Slovakia (28th September 2000). The Commission of the European Communities takes part in the work of the OECD (Article 13 of the OECD Convention).

AGENCE INTERNATIONALE DE L'ÉNERGIE

9, RUE DE LA FEDERATION, 75739 PARIS CEDEX 15, FRANCE

L'agence internationale de l'énergie (AIE) est un organe autonome institué en novembre 1974 dans le cadre de l'Organisation de coopération et de développement économiques (OCDE) afin de mettre en œuvre un programme international de l'énergie.

Elle applique un programme général de coopération dans le domaine de l'énergie entre vingt-six* des trente pays Membres de l'OCDE. Les objectifs fondamentaux de l'AIE sont les suivants :

- tenir à jour et améliorer des systèmes permettant de faire face à des perturbations des approvisionnements pétroliers ;
- œuvrer en faveur de politiques énergétiques rationnelles dans un contexte mondial grâce à des relations de coopération avec les pays non membres, l'industrie et les organisations internationales ;
- gérer un système d'information continue sur le marché international du pétrole ;
- améliorer la structure de l'offre et de la demande mondiales d'énergie en favorisant la mise en valeur de sources d'énergie de substitution et une utilisation plus rationnelle de l'énergie ;
- contribuer à l'intégration des politiques d'énergie et d'environnement.

** Pays Membres de l'AIE : Allemagne, Australie, Autriche, Belgique, Canada, Danemark, Espagne, États-Unis, Finlande, France, Grèce, Hongrie, Irlande, Italie, Japon, Luxembourg, Norvège, Nouvelle-Zélande, Pays-Bas, Portugal, République de Corée, République Tchèque, Royaume-Uni, Suède, Suisse et Turquie. La Commission des Communautés européennes participe également aux travaux de l'AIE.*

ORGANISATION DE COOPÉRATION ET DE DÉVELOPPEMENT ÉCONOMIQUES

En vertu de l'article 1er de la Convention signée le 14 décembre 1960, à Paris, et entrée en vigueur le 30 septembre 1961, l'Organisation de Coopération et de Développement Économiques (OCDE) a pour objectif de promouvoir des politiques visant :

- à réaliser la plus forte expansion de l'économie et de l'emploi et une progression du niveau de vie dans les pays Membres, tout en maintenant la stabilité financière, et à contribuer ainsi au développement de l'économie mondiale ;
- à contribuer à une saine expansion économique dans les pays Membres, ainsi que les pays non membres, en voie de développement économique ;
- à contribuer à l'expansion du commerce mondial sur une base multilatérale et non discriminatoire conformément aux obligations internationales.

Les pays Membres originaires de l'OCDE sont : l'Allemagne, l'Autriche, la Belgique, le Canada, le Danemark, l'Espagne, les États-Unis, la France, la Grèce, l'Irlande, l'Islande, l'Italie, le Luxembourg, la Norvège, les Pays-Bas, le Portugal, le Royaume-Uni, la Suède, la Suisse et la Turquie. Les pays suivants sont ultérieurement devenus Membres par adhésion aux dates indiquées ci-après : le Japon (28 avril 1964), la Finlande (28 janvier 1969), l'Australie (7 juin 1971), la Nouvelle-Zélande (29 mai 1973), le Mexique (18 mai 1994), la République Tchèque (21 décembre 1995), la Hongrie (7 mai 1996), la Pologne (22 novembre 1996), la République de Corée (12 décembre 1996) et la République Slovaque (28 septembre 2000). La Commission des Communautés européennes participe aux travaux de l'OCDE (article 13 de la Convention de l'OCDE).

INTRODUCTION

This publication is intended for those involved in analytical and policy work related to international energy issues. It provides detailed statistics on production, trade and consumption for each source of energy in more than 100 non-OECD countries, and main regions, including developing countries, Central and Eastern European countries and the former USSR. The consistency and complementarity of OECD and non-OECD countries' statistics ensure an accurate picture of the global energy situation.

The data shown in this publication for the Member countries of the Economic Commission for Europe of the United Nations (UN-ECE) are based mostly on information provided in five annual questionnaires common to the OECD, the UN-ECE and the European Union: "Oil", "Natural Gas", "Solid Fossil Fuels", "Renewables and Wastes", and "Electricity and Heat" completed by the national administrations.

The commodity balances for the other countries are based on national energy data of heterogeneous nature which have been converted and adjusted to fit the IEA's format. This volume has been prepared in close collaboration with other international organisations including the Organizacíon Latino Americana De Energía (OLADE), the Asia Pacific Energy Research Centre, the Statistical Office of the United Nations; the Organisation of Petroleum Exporting Countries (OPEC), and the Forestry Department of the Food and Agriculture Organisation (FAO) of the United Nations. It draws upon and complements the extensive work of the United Nations in the field of world energy statistics.

While every effort is made to ensure the accuracy of the data, quality is not homogeneous throughout the publication. Special methodological issues arise in a number of countries. In some countries data are based on secondary sources, and where incomplete or unavailable, on estimates. In general, data are likely to be more accurate for production, trade and total consumption than for individual sectors in transformation or final consumption. Commodity balances are presented in two formats reflecting the degree of detail available. Moreover, the breakdown by fuel of electricity and heat production in the transformation sector provided in the *Energy Statistics of OECD Countries* is not shown in this publication. General issues of data quality, country notes and individual country data should be consulted when using regional aggregates.

A companion volume – *Energy Balances of Non-OECD Countries 1999-2000* – presents corresponding data in comprehensive balances expressed in a common unit, million tonnes of oil equivalent (Mtoe), with 1 toe = 10^7 kcal = 41.868 gigajoules.

Energy data on OECD and non-OECD countries are collected by the team in the Energy Statistics Division (ESD) of the IEA Secretariat, headed by Mr. Jean-Yves Garnier. Non-OECD countries statistics are currently the responsibility of Ms. Gaëlle Balestat, Ms. Stephane de la Rue du Can, Mrs. Emmanuelle Guidetti and Mrs. Corinne Heckmann, with the assistance of Ms. Yukimi Shimura. Mr. Fahri Karbuz and Mr. Pierpaolo Cazzola. Mr. Riccardo Quercioli has overall editorial responsibility. Secretarial support was supplied by Mrs. Susan Stolarow and Ms. Diana Browne. We would like to thank our numerous contacts world-wide in national administrations, and in public and private companies for their helpful co-operation.

Also in the IEA Secretariat, thanks are due to Mr. Lawrence Metzroth for his assistance with non-OECD coal statistics.

Complete supply and consumption data from 1971 to 2000 are available on CD-ROM suitable for use on IBM-compatible personal computers. An order form has been provided in the back of this publication.

In addition, a data service is available on the internet. It includes unlimited access through an annual subscription as well as the possibility to obtain data or a pay-per-view basis. Details are available at http://www.iea.org.

Enquiries about data, methodology, or comments and suggestions should be addressed to the head of the non-OECD Countries Section, Energy Statistics Division, at:

INTRODUCTION

Ce recueil s'adresse aux lecteurs qui participent aux travaux d'analyse et d'étude des questions de fond concernant la situation énergétique internationale. Elle fournit, pour chaque source d'énergie, des statistiques détaillées sur la production, les échanges et la consommation dans plus de 100 pays ne faisant pas partie de l'OCDE ainsi que pour plusieurs régions qui comprennent des pays en développement, des pays d'Europe centrale et orientale et l'ex-URSS. La compatibilité et la complémentarité des statistiques des pays membres de l'OCDE et des pays ne faisant pas partie de l'OCDE garantissent la qualité de l'image de la situation énergétique mondiale.

Les données publiées sur les pays membres de la Commission Economique pour l'Europe des Nations Unies (CEE-ONU) sont basées sur les informations recueillies dans cinq questionnaires annuels communs de l'OCDE, de la CEE-ONU et de l'Union Européenne : « Pétrole », « Gaz naturel », « Combustibles fossiles solides », "Energies renouvelables et déchets" et « Electricité et chaleur », remplis par les administrations nationales. Les bilans par produit des autres pays sont basés sur des statistiques énergétiques nationales de nature hétérogène qui ont été converties et harmonisées afin d'être conformes au format de l'AIE. Ce document a été préparé en étroite collaboration avec d'autres organisations internationales dont l'Organización Latino Americana De Energía (OLADE), le Asia Pacific Energy Research Centre, le Bureau de Statistiques des Nations Unies, Organisation des pays exportateurs de pétrole (OPEP) et le Département des forêts de l'Organisation des Nations Unies pour l'Alimentation et l'Agriculture (FAO). Il utilise et complète le travail considérable déjà accompli par les Nations Unies dans le domaine des statistiques énergétiques.

Bien que tout ait été mis en œuvre pour assurer l'exactitude de ces données, la qualité des chiffres de cette publication n'est pas toujours homogène. Des problèmes méthodologiques particuliers se posent dans un certain nombre de pays. Par ailleurs pour certains pays les données proviennent de sources secondaires et, lorsque les données manquent, elles sont basées sur des estimations. D'une façon générale, les chiffres sont sans doute plus exacts en ce qui concerne la production, les échanges et la consommation totale que pour les secteurs désagrégés de la transformation ou de la consommation finale. Les bilans par produit sont présentés en deux formats différents selon les détails disponibles. De plus, la ventilation par combustible de la production d'électricité et de chaleur du secteur transformation fournie dans les *Statistiques de l'énergie des pays de l'OCDE* n'est pas présentée dans la présente publication. Il convient, lors de l'utilisation des agrégats régionaux, de consulter également la note générale sur la qualité des données, les notes relatives aux différents pays et les données par pays.

Un recueil complémentaire - *Bilans énergétiques des pays non-membres 1999-2000* - contient des données équivalentes et exprimées sous la forme de bilans globaux dans une unité commune, à savoir en millions de tonnes d'équivalent pétrole (Mtep), sur la base de 1 tep = 10^7 kcal = 41,868 gigajoules.

Les données énergétiques sur les pays membres et non-membres de l'OCDE sont collectées par la Division des statistiques énergétiques (ESD) du Secrétariat de l'AIE, dirigée par M. Jean-Yves Garnier. Mlle Gaëlle Balestat, Mlle Stéphane de la Rue du Can, Mme Emmanuelle Guidetti et Mme Corinne Heckmann sont actuellement responsables des statistiques des pays non-membres

de l'OCDE, avec l'assistance de Mlle Yukimi Shimura, M. Fahri Karbuz et M. Pierpaolo Cazzola. M. Riccardo Quercioli est responsable de la publication. Mme Susan Stolarow et Mlle Diana Browne ont assuré le secrétariat d'édition et la saisie des textes.

Nous aimerions remercier les personnes des administrations nationales avec qui nous sommes en contact pour leur aide précieuse.

Nous aimerions aussi remercier M. Lawrence Metzroth du Secrétariat de l'AIE pour son assistance avec les statistiques du charbon des pays non-membres.

Des données complètes sur l'offre et la demande sont disponibles, pour les années 1971 à 2000, sur CD-ROM par des ordinateurs personnels compatibles IBM. Un formulaire de commande est fourni à la fin de cet ouvrage.

En outre, un service de données est disponible sur internet. Ce service comprend une souscription annuelle pour un accès illimité ou bien la possibilité de payer uniquement pour des données sélectionnées. Pour plus de détails, veuillez consulter http://www.iea.org.

Les demandes de renseignements sur les données ou la méthodologie doivent être adressées au chef de la section des pays non-membres, division des statistiques de l'énergie :

PART I: METHODOLOGY

PARTIE I : METHODOLOGIE

1. ISSUES OF DATA QUALITY

A. Methodology

Considerable effort has been made to ensure that data presented in this publication adhere to the IEA definitions contained in the General Notes (Part I.2 and 3). These definitions are used by most of the international organisations that collect energy statistics. Nevertheless, the national energy statistics which are reported to international organisations are often collected using criteria and definitions which differ, sometimes considerably, from those employed by the international organisations. The extent to which the IEA Secretariat has identified these differences and, where possible, adjusted the data to meet international definitions, is outlined below. Recognised anomalies occurring in specific countries are presented in Part I.6, Country Notes and Sources. The Country Notes simply identify some of the more important and obvious deviations from IEA methodology in certain countries and are by no means a comprehensive list of anomalies by country.

B. Estimation

In addition to any adjustments undertaken to compensate for differences in definitions, estimations are sometimes required to complete major aggregates from which key statistics are missing. Examples may be found in the more detailed accounts given below. Except as concerns combustible renewables and waste (see E.5 below), it has been the Secretariat's aim to provide all of the elements of commodity balances down to the level of Final Consumption for all countries and years. This entails providing the elements of supply as well as inputs of primary fuels and outputs of secondary fuels to and from the main transformation activities such as oil refining and electricity generation. This has often required estimations prepared after consultation with national statistical offices, oil companies, electricity utilities and national energy experts.

C. Time Series and Political Changes

Commodity balances for the republics of the former USSR have been constructed since 1992. These balances have been constructed from official data and, where necessary, estimates have been made based on information obtained from industry sources and other international organisations. Summary tables and commodity balances for the country 'former USSR' are the sum of individual former USSR republics. This is also the case for the country 'Former Yugoslavia'.

Energy statistics for some countries undergo continuous changes in their coverage or methodology. Consequently, "breaks in series" are considered to be unavoidable.

The IEA Secretariat reviews its databases each year. In the light of new assessments, important revisions are made to the time series of individual countries during the course of this review. Therefore, some data in this publication have been substantially revised with respect to previous editions. Please see country notes on that.

D. Classification of Fuel Uses

National statistics sources often lack adequate information on the consumption of fuels in different categories of end use. Many countries do not conduct annual surveys of the fuel consumption in the main sectors of economic activity and consequently published data are based on out-of-date surveys. Sectoral disaggregation of consumption for individual countries should therefore be interpreted with caution.

Previous to the reforms undertaken in the 1990's the sectoral classification of fuel consumption in the transition economies (eastern Europe and the countries of the former USSR) and China differed greatly from that practised in market economies. Sectoral consumption was defined according to the economic branch to which the user of the fuel belonged rather than according to the purpose or use of the fuel. Consumption of gasoline in the vehicle fleet of an enterprise attached to the economic branch 'iron and steel' was classified as industrial consumption of gasoline in the iron and steel industry. Where possible, the data have been adjusted to fit international classifications, for example, all gasoline is assumed to be consumed in the 'transport' sector and is reported in this publication as such. However, it has not been possible to reclassify products other than gasoline and jet fuel with the same facility, and few adjustments have been made to the remaining products.

E. Specific Issues by Fuel

1. Oil

The IEA Secretariat collects comprehensive statistics for oil supply and use, including refineries' own use of oil, oil delivered to ships' bunkers and oil for use as petrochemical feedstock. National statistics often do not report these amounts. Reported production of refined products frequently refers to net rather than gross refinery output and consumption of oil products may be limited to sales to domestic markets and may not include deliveries to international shipping or aircraft. Oil consumed as petrochemical feedstock in integrated refinery/petrochemical complexes is often not included in available official statistics.

Where possible, the Secretariat, in consultation with the oil industry, makes estimates of these unreported data. In the absence of any other indication of refinery fuel use the consumption has been estimated to be about 5 per cent of refinery throughput and has been divided equally between refinery gas and heavy fuel oil.

For a description of the nature of the adjustments made to the sectoral consumption of oil products, see above section 'Classification of Fuel Uses'.

2. Natural Gas

The IEA defines natural gas production as marketable production, i.e. that which is net of field losses, flaring, venting and reinjection. Furthermore, natural gas should be comprised mainly of methane and other gases such as ethane and higher hydrocarbons should be reported under the heading of 'oil'.

Readily available data for natural gas, however, often do not identify the separate elements of field losses, flaring, venting and reinjection. Moreover, reported data are frequently unaccompanied by adequate definitions so that it is difficult or impossible to identify gas at the different stages of its separation into dry gas (methane) and the heavier fractions in gas separation facilities.

Natural gas supply and demand statistics are normally reported in volumetric units and it is difficult to obtain accurate data on the calorific value of the gas. Where the heat value is unknown, a general gross calorific value of 38 TJ/million m^3 has been applied.

It should also be noted that reliable consumption data for natural gas at a disaggregated level are often difficult to locate. This is especially true of some of the larger natural gas consuming countries in the Middle East. Industrial use of natural gas for these countries is therefore frequently missing from data appearing in this publication.

3. Electricity

As defined in the General Notes (Part I.2), an autoproducer of electricity is an establishment which, in addition to its main activities, generates electricity wholly or partly for its own use. Data on the basis of this definition are frequently unknown in non-OECD countries. In such cases the fuels inputs for autoproduced electricity are reported in the appropriate end use sector.

When statistics of the production of electricity from inputs of Combustible Renewables and Waste are available, they are included in total electricity production. These data are not comprehensive; for example, much of the electricity generated from waste biomass in sugar refining remains unreported.

Inputs of fuels for electricity generation are estimated (when unreported) using information on electricity output, fuel efficiency and the type of generation capacity.

4. Heat

The transition economies (eastern Europe and countries of the former USSR) and China employed a methodology with respect to heat that set them apart from common practice in market economies. The approach taken was to allocate the transformation of primary fuels (coal, oil and gas) by industry into heat *for consumption on site* to the transformation activity *Heat Production*, not to industrial consumption as in the IEA methodology[1]. The transformation output of *Heat* was then allocated to the various end use sectors. The losses occurring in the transformation of fuels into heat in industry were not included in final consumption of industry. Although a number of countries have recently switched to the practice of the international organisations, this important distinction reduces the validity of cross-country comparisons of sectoral end use consumption between transition economies and market economies.

5. Combustible Renewables and Waste

The IEA publishes production and domestic supply of combustible renewables and waste for all non-OECD countries and all regions for the years 1974 to 2000 (1971 to 2000 on CD ROM).

Data shown are often from secondary sources, inconsistent and may be of questionable quality, which makes comparisons between countries difficult. The historical data of many countries derive from surveys which were often irregular, irreconcilable and conducted at the local rather than national level making them incomparable between regions and time. Where historical series are incomplete or unavailable, they have been estimated using the methodology consistent with the projection framework of the IEA's 1998 edition of *World Energy Outlook* (September 1998). First, nation-wide biomass and wastes domestic supply per capita was compiled or estimated for 1995. Secondly, per capita supply for the years 1971 to 1994 was estimated, using a log/log equation with either GDP per capita or the percentage of urban population as the exogenous variable, depending on the region. Thirdly, total biomass and waste supply after 1996 was estimated assuming a growth rate either constant, or equal to the population growth, or following the 1971-1994 estimation. However, these estimated time-series should be treated very cautiously.

The chart below attempts to provide a broad indication of the data quality and estimation methodology by region.

Region	Main source of data	Data Quality	Exogenous Variables
Africa	FAO database and AfDB	Low	% urban population
Latin America	National and OLADE	High	None
Asia	Surveys	High to Low	GDP per capita
Non-OECD Europe	Questionnaires and FAO	High to Medium	None
Former USSR	National and questionnaires and FAO	High to Medium	None
Middle East	FAO	Medium to Low	None

Although the methods used for estimations are consistent with those used for biomass in the *World Energy Outlook 2002*, minor numerical discrepancies occur for a number of reasons. The reasons include later data revisions and the level of country disaggregations employed.

For the years 1994 to 2000, balances down to final consumption by end-use for individual products or product categories have been compiled for all the countries. The data for the years 1999 and 2000 are shown in the Annual Tables. Charcoal production is shown in the Summary Tables. The figures confirm the importance of vegetal fuels in the energy sector of many developing countries.

The IEA hopes that the inclusion of these data will encourage national administrations and other agencies active in the field to enhance the level and quality of data collection and coverage. More details on the methodology used by country may be provided on request, and comments are welcome.

1 The international methodology restricts the inclusion of heat in transformation sector to that sold to third parties. See definition in Part I.2.

2. GENERAL NOTES

The tables include all "commercial" sources of energy, both primary (hard coal, brown coal/lignite, peat, natural gas, crude oil, NGL, hydro, geothermal/solar, wind, tide, etc. and nuclear power) and secondary (coal products, manufactured gases, petroleum products, electricity and heat). Data also include various sources of combustible renewables and waste, such as solid biomass, liquid biomass, municipal waste and industrial waste.

Each table is divided into three main parts: the first showing *supply* elements, the second showing the *transformation* and *energy* sectors, and the third showing *final consumption* broken down into the various end-use sectors.

The following description refers to the layout of the full commodity balance type presentation. In the case of the regional and abbreviated tables, the definition of the products is the same. However, sectoral breakdown has been restricted to main totals (Energy Sector, etc.) and to selected main categories (Iron and Steel, etc.).

A. Supply

The first part of the basic energy balance shows the following elements of supply:

Production
\+ *Inputs from other sources*
\+ *Imports*
\- *Exports*
\- *International marine bunkers*
± *Stock changes*
= *Domestic supply*

1. Production

Production refers to the quantities of fuels extracted or produced, calculated after any operation for removal of inert matter or impurities (e.g. sulphur from natural gas).

2. Inputs from Other Sources

All inputs of origin other than primary energy sources explicitly recognised in the tables are listed under inputs *from other sources*, e.g. under crude oil: inputs of origin other than crude oil and NGL such as hydrogen, synthetic crude oil (including mineral oil extracted from bituminous minerals such as shales, bituminous sand, etc.); under additives: benzol, alcohol and methanol produced from natural gas; under refinery feedstocks: backflows from the petrochemical industry used as refinery feedstocks; under hard coal: recovered slurries, middlings, recuperated coal dust and other low-grade coal products that cannot be classified according to type of coal from which they are obtained; under gas works gas: natural gas, refinery gas, and LPG, that are treated or mixed in gas works (i.e. gas works gas produced from sources other than coal).

3. Imports and Exports

Imports and exports comprise amounts having crossed the national territorial boundaries of the country whether or not customs clearance has taken place.

a) Coal

Imports and exports comprise the amount of fuels obtained from or supplied to other countries, whether or not there is an economic or customs union between the relevant countries. Coal in transit should not be included.

b) Oil and Gas

Quantities of crude oil and oil products imported or exported under processing agreements (i.e. refining on account) are included. Quantities of oil in transit are excluded. Crude oil, NGL and natural gas are reported as coming from the country of origin; refinery feedstocks and oil products are reported as coming from the country of last consignment.

Re-exports of oil imported for processing within bonded areas are shown as an export of product from the processing country to the final destination.

c) Electricity

Amounts are considered as imported or exported when they have crossed the national territorial boundaries of the country. If electricity is "wheeled" or transited through a country, the amount is shown as both an import and an export.

4. International Marine Bunkers

International marine bunkers cover those quantities delivered to sea-going ships of all flags, including warships. Consumption by ships engaged in transport in inland and coastal waters and by fishing vessels in all waters is not included. See definitions of transport (Section 2.C.2) and agriculture (Section 2.C.3).

5. Stock Changes

Stock changes reflect the difference between opening stock levels on the first day of the year and closing levels on the last day of the year of stocks on national territory held by producers, importers, energy transformation industries and large consumers. Oil and gas stock changes in pipelines are not taken into account. With the exception of large users mentioned above, changes in final users' stocks are not taken into account. A stock build is shown as a negative number, and a stock draw as a positive number.

6. Domestic Supply

Domestic supply is defined as production + inputs from other sources + imports - exports - international marine bunkers ± stock changes.

7. Transfers

Transfers comprise *interproduct transfers, products transferred* and *recycled products.*

Interproduct transfers result from reclassification of products either because their specification has changed or because they are blended into another product, e.g. kerosene may be reclassified as gasoil after blending with the latter in order to meet its winter diesel specification. The net balance of *interproduct transfers* is zero.

Products transferred is intended for petroleum products imported for further processing in refineries. For example, fuel oil imported for upgrading in a refinery is transferred to the feedstocks category.

Recycled products are finished products which pass a second time through the marketing network, **after** having been once delivered to final consumers (e.g. used lubricants which are reprocessed).

8. Statistical Differences

Statistical difference is defined as deliveries to final consumption + use for transformation and consumption within the energy sector + distribution losses – domestic supply – transfers. Statistical differences arise because the data for the individual components of supply are often derived from different data sources by the national administration. Furthermore, the inclusion of changes in some large consumers' stocks in the supply part of the balance introduces distortions which also contribute to the statistical differences.

B. Transformation and Energy Sectors

The *transformation sector* comprises the conversion of primary forms of energy to secondary and further transformation (e.g. coking coal to coke, crude oil to petroleum products, heavy fuel oil to electricity).

The *energy sector* comprises the amount of fuels used by the energy producing industries (e.g. for heating, lighting and operation of all equipment used in the extraction process, for traction and for distribution).

The following categories are distinguished in the *transformation* and *energy* sectors:

1. Transformation Sector

- *Electricity plants* (refers to plants which are designed to produce electricity only). If one or

more units of the plant is a CHP unit (and the inputs and outputs can not be distinguished on a unit basis) then the whole plant is designated as a CHP plant. Both public[2] and autoproducer[3] plants are included here.

- *Combined heat and power plants* (refers to plants which are designed to produce both heat and electricity). UNIPEDE refers to these as co-generation power stations. If possible, fuel inputs and electricity/heat outputs are on a unit basis rather than on a plant basis. However, if data are not available on a unit basis, the convention for defining a CHP plant noted above should be adopted. Both public and autoproducer plants are included here. *Note that for autoproducer's CHP plants, all fuel inputs to electricity production are taken into account, while only the part of fuel inputs to heat* ***sold*** *is shown. Fuel inputs for the production of heat consumed within the autoproducer's establishment are* ***not*** *included here but are included with figures for the final consumption of fuels in the appropriate consuming sector.*
- *Heat plants* (refers to plants [including heat pumps and electric boilers] designed to produce heat only and who sell heat to a third party [e.g. residential, commercial or industrial consumers] under the provisions of a contract). Both public and autoproducer plants are included here.
- *Blast furnaces/Gas works* (covers the quantities of fuels used for the production of town gas, blast furnace gas and oxygen steel furnace gas). The production of pig-iron from iron ore in blast furnaces uses fuels for supporting the blast furnace charge and providing heat and carbon for the reduction of the iron ore. Accounting for the calorific content of the fuels entering the process is a complex matter as transformation (into blast furnace gas) and consumption (heat of combustion) occur simultaneously. Some carbon is also retained in the pig-iron; almost all of this reappears later in the oxygen steel furnace gas (or converter gas) when the pig-iron is converted to steel. In principle, the quantities of all fuels (e.g. pulverised coal injection (PCI) coal, coke oven coke, natural gas and oil) entering blast furnaces and the quantity of blast furnace gas and oxygen steel furnace gas produced are collected. However, except for coke oven coke inputs, the data are often uncertain or incomplete. The Secretariat then needs to split these inputs into the transformation and consumption components. The transformation component is shown in the row *blast furnaces/gas works* in the column appropriate for the fuel, and the consumption component is shown in the row *iron and steel* in final consumption in the column appropriate for the fuel. Starting with 1999, the Secretariat decided to assume an 80/20 split of coke oven coke between the transformation and consumption components. This results in more of the energy inputs appearing in the *blast furnaces/gas works* row and less appearing in the *iron and steel* row than in the previous editions. This split has been estimated based on the results of the model developed for OECD countries.[4] It provides a more consistent balancing of the carbon input into and output from the blast furnaces when the IEA data are used to calculate CO_2 emissions from fuel combustion using the Intergovernmental Panel on Climate Change (IPCC) methodology as published in the *Revised 1996 IPCC Guidelines for National Greenhouse Gas Inventories.*[5]
- *Coke/Patent fuel/BKB plants* (covers the use of fuels for the manufacture of coke, coke oven gas, patent fuels and BKB).
- *Petroleum refineries* (covers the use of hydrocarbons for the manufacture of finished petroleum products).
- *Petrochemical industry* (covers backflows returned from the petrochemical sector). Note, backflows from oil products that are used for non-energy purposes (i.e. white spirit and lubricants) are not included here, but in non-energy use.

2 Public supply undertakings generate electricity and/or heat for sale to third parties, *as their primary activity*. They may be privately or publicly owned. Note that the sale need not take place through the public grid.

3 Autoproducer undertakings generate electricity and/or heat, wholly or partly for their own use as an activity which supports their primary activity. They may be privately or publicly owned.

4 Please refer to *Energy Statistics of OECD Countries* for more information on the blast furnace model used for the OECD countries.

5 The *Revised 1996 IPCC Guidelines for National Greenhouse Gas Inventories* are available from the IPCC National Greenhouse Gas Inventories Programme at http://www.ipcc-nggip.iges.or.jp.

- *Liquefaction plants* (includes diverse liquefaction processes, such as coal and natural gas liquefaction in South Africa).
- *Other transformation sector* (includes the transformation of solid biomass into charcoal and other non-specified transformation).

2. Energy Sector

Energy producing industries' own use includes energy consumed by transformation industries for heating, pumping, traction and lighting purposes [ISIC[6] Divisions 10, 11, 12, 23 and 40]:

- *Coal mines* (hard coal and lignite);
- *Oil and gas extraction* (flared gas is not included);
- *Petroleum refineries*;
- *Electricity, CHP and heat plants*;
- *Pumped storage* (electricity consumed in hydro-electric plants);
- *Other energy sector* (including own consumption in patent fuel plants, coke ovens, gas works, blast furnaces, BKB and lignite coke plants, liquefaction plants, gasification plants, charcoal production plants, nuclear plants, as well as the non-specified energy sector's use).

3. Distribution losses

Distribution losses include losses in gas distribution, electricity transmission, and coal transport. It may also include unaccounted for use of crude oil and petroleum products.

C. Final Consumption

The term *final consumption* (equal to the sum of end-use sectors' consumption) implies that energy used for transformation and for own use of the energy producing industries is excluded. Final consumption reflects for the most part deliveries to consumers (see note on stock changes in Section 2.A.5).

In final consumption, petrochemical feedstocks are covered under **industry** as an *of which* item under chemical industry for those oil products that are principally used for energy purposes. Separated from these are the other oil products that are mainly used for non-energy purposes (see non-energy use in Section 2.C.4), which are shown in the rows for non-energy uses and included only in **total final consumption**. Backflows from the petrochemical industry are not included in final consumption (see Sections 2.A.2 and 2.B.1).

1. Industry Sector

Consumption of the *industry sector* is specified in the following sub-sectors (energy used for transport by industry is not included here but is reported under transport):

- *Iron and steel industry* [ISIC Group 271 and Class 2731];
- *Chemical industry* [ISIC Division 24];
- *of which: petrochemical feedstocks*. The petrochemical industry includes cracking and reforming processes for the purpose of producing ethylene, propylene, butylene, synthesis gas, aromatics, butadene and other hydrocarbon-based raw materials in processes such as steam cracking, aromatics plants and steam reforming. [Part of ISIC Group 241]; See feedstocks under Section 2.C.4 (Non-energy use);
- *Non-ferrous metals* basic industries [ISIC Group 272 and Class 2732];
- *Non-metallic mineral* products such as glass, ceramic, cement, etc. [ISIC Division 26];
- *Transport equipment* [ISIC Divisions 34 and 35];
- *Machinery*. Fabricated metal products, machinery and equipment other than transport equipment [ISIC Divisions 28, 29, 30, 31 and 32];
- *Mining (excluding fuels) and quarrying* [ISIC Divisions 13 and 14];
- *Food and tobacco* [ISIC Divisions 15 and 16];
- *Paper, pulp and print* [ISIC Divisions 21 and 22];
- *Wood and wood products* (other than pulp and paper) [ISIC Division 20];

6 International Standard Industrial Classification of All Economic Activities, Series M, No. 4/Rev. 3, United Nations, New York, 1990.

- *Construction* [ISIC Division 45];
- *Textile and leather* [ISIC Divisions 17, 18 and 19];
- *Non-specified* (any manufacturing industry not included above) [ISIC Divisions 25, 33, 36 and 37];

Note: Most countries have difficulties supplying an industrial breakdown for all fuels. In these cases, the *non-specified* industry row has been used. *Regional aggregates of industrial consumption should therefore be used with caution.*

2. Transport Sector

Consumption in the *Transport sector* covers all transport activity in mobile engines regardless of the economic sector to which it is contributing [ISIC Divisions 60, 61 and 62], and is divided into the following sub-sectors:

- *Air*: Deliveries of aviation fuels to international civil aviation and to all domestic air transport, commercial, private, agricultural, military, etc. It also includes use for purposes other than flying, e.g. bench testing of engines, but not use of fuels for road transport by airline companies;
- *Road*: All fuels used in road vehicles (including military) as well as agricultural and industrial highway use. Excludes motor gasoline used in stationary engines, and diesel oil for use in tractors that are not for highway use;
- *Rail*: All quantities used in rail traffic, including industrial railways;
- *Pipeline transport*: Energy used for transport of materials by pipeline;
- *Internal navigation* (including small craft and coastal vessels not purchasing their bunker requirements under international marine bunker contracts). Fuel used for ocean, coastal and inland fishing should be included in agriculture;
- *Non-specified*.

3. Other Sectors

- *Agriculture*: Defined as all deliveries to users classified as agriculture, hunting and forestry by the ISIC, and therefore includes energy consumed by such users whether for traction (excluding agricultural highway use), power or heating (agricultural and domestic). Also includes fuels used for ocean, coastal and inland fishing. ISIC Divisions 01, 02 and 05;
- *Commercial and public services*: All activities coming into ISIC Divisions 41, 50, 51, 52, 55, 63, 64, 65, 66, 67, 70, 71, 72, 73, 74, 75, 80, 85, 90, 91, 92, 93 and 99;
- *Residential*: All consumption by households, excluding fuels used for transport. Includes households with employed persons (ISIC Division 95) which is a small part of total residential consumption;
- *Non-specified*: Includes all fuel use not elsewhere specified (e.g. military fuel consumption with the exception of transport fuels in international marine bunkers, the domestic air and road sectors and consumption in the above-designated categories for which separate figures have not been provided).

4. Non-energy use

Non-energy use covers use of *other* petroleum products such as white spirit, paraffin waxes, lubricants, bitumen and other products (see Sections 3.C.10 and 3.C.11). It also includes the non-energy use of coal (excluding peat). They are shown separately in final consumption under the heading *non-energy use*. It is assumed that the use of these products is exclusively non-energy use. It should be noted that petroleum coke is shown as *non-energy use* only when there is evidence of such use, otherwise it is shown under energy use in industry or in other sectors.

Feedstocks for petrochemical industry are accounted for in industry under chemical industry and shown separately under: *of which: feedstocks*. This covers all oil and gas, including naphtha except the *other petroleum products* listed in Section 3.C.11.

3. NOTES ON ENERGY SOURCES

A. Coal

The heading *coal mines* refers only to coal which is used directly within the coal industry. It excludes coal burned in pithead power stations (included under *transformation* - electricity plants) and free allocations to miners and their families (considered as part of household consumption and therefore included under *other sectors* - residential).

1. Coking Coal

Coking coal refers to coal with a quality that allows the production of a coke suitable to support a blast furnace charge. Its gross calorific value is greater than 23 865 kJ/kg (5 700 kcal/kg) on an ash-free but moist basis.

2. Other Bituminous Coal and Anthracite

Other bituminous coal is used for steam raising and space heating purposes and includes all anthracite coals and bituminous coals not included under coking coal. Its gross calorific value is greater than 23 865 kJ/kg (5 700 kcal/kg), but usually lower than that of coking coal.

3. Sub-Bituminous Coal

Non-agglomerating coals with a gross calorific value between 17 435 kJ/kg (4 165 kcal/kg) and 23 865 kJ/kg (5 700 kcal/kg) containing more than 31 per cent volatile matter on a dry mineral matter free basis.

4. Lignite and Brown Coal

Lignite/brown coal is a non-agglomerating coal with a gross calorific value of less than 17 435 kJ/kg (4 165 kcal/kg), and greater than 31 per cent volatile matter on a dry mineral matter free basis.

Oil shale and tar sands produced and combusted directly are included in this category. Oil shale and tar sands used as inputs for other transformation processes are also included here. This includes the portion of the oil shale or tar sands consumed in the transformation process. Shale oil and other products derived from liquefaction are included in *from other sources* under crude oil (*other hydrocarbons*).

5. Peat

Combustible soft, porous or compressed, fossil sedimentary deposit of plant origin with high water content (up to 90 per cent in the raw state), easily cut, of light to dark brown colour. Peat used for non-energy purposes is not included.

6. Coke Oven Coke and Gas Coke

Coke oven coke is the solid product obtained from the carbonisation of coal, principally coking coal, at high temperature. It is low in moisture content and volatile matter. Also included are semi-coke, a solid product obtained from the carbonisation of coal at a low temperature, lignite coke and semi-coke made from lignite/brown coal, coke breeze and foundry coke. The heading *other energy sector* represents consumption at the coking plants themselves. Consumption in the iron and steel industry does not include coke converted into blast furnace gas. To obtain the total consumption of coke oven coke in the iron and steel industry, the quantities converted into blast furnace gas have to be added (these are shown under *blast furnaces/gas works*).

Gas coke is a by-product of hard coal used for the production of town gas in gas works. Gas coke is used for heating purposes. *Other energy sector* data represent consumption of gas coke at gas works.

7. Patent Fuel and Brown Coal / Peat Briquettes (BKB)

Patent fuel is a composition fuel manufactured from hard coal mines with the addition of a binding agent. The amount of patent fuel produced is, therefore, slightly higher than the actual amount of coal consumed in the transformation process. Consumption of patent fuels during the patent fuel manufacturing process is shown under *other energy sector*.

BKB are composition fuels manufactured from lignite/brown coal, produced by briquetting under high pressure. These figures include peat briquettes, dried lignite fines and dust. The heading *other energy sector* includes consumption by briquetting plants.

B. Crude Oil, NGL, Refinery Feedstocks

Petroleum refineries under *transformation* shows inputs of crude oil, NGL, refinery feedstocks, additives and other hydrocarbons into the refining process.

1. Crude Oil

Crude oil is a mineral oil consisting of a mixture of hydrocarbons of natural origin, being yellow to black in colour, of variable density and viscosity. It also includes lease condensate (separator liquids) which are recovered from gaseous hydrocarbons in lease separation facilities.

Other hydrocarbons, including synthetic crude oil, mineral oils extracted from bituminous minerals such as shales, bituminous sand, etc., and oils from coal liquefaction are included in the row *from other sources*. See Section 2.A.2.

Emulsified oils (e.g. orimulsion) are included here.

2. Natural Gas Liquids (NGL)

NGLs are the liquid or liquefied hydrocarbons produced in the manufacture, purification and stabilisation of natural gas. These are those portions of natural gas which are recovered as liquids in separators, field facilities, or gas processing plants. NGLs include but are not limited to ethane, propane, butane, pentane, natural gasoline and condensate. They may also include small quantities of non-hydrocarbons.

3. Refinery Feedstocks

A refinery feedstock is a product or a combination of products derived from crude oil and destined for further processing other than blending in the refining industry. It is transformed into one or more components and/or finished products. This definition covers those finished products imported for refinery intake and those returned from the petrochemical industry to the refining industry.

4. Additives

Additives are non-hydrocarbon substances added to or blended with a product to modify its properties, for example, to improve its combustion characteristics. Alcohols and ethers (MTBE, methyl tertiary-butyl ether) and chemical alloys such as tetraethyl lead are included here. Ethanol is not included here, but under *Gas/Liquids from Biomass*.

C. Petroleum Products

Petroleum products are any oil-based products which can be obtained by distillation and are normally used outside the refining industry. The exceptions to this are those finished products which are classified as refinery feedstocks above.

Production of petroleum products shows gross refinery output for each product.

Refinery fuel (row *petroleum refineries*, under *energy sector*) represents consumption of petroleum products, both intermediate and finished, within refineries, e.g. for heating, lighting, traction, etc.

1. Refinery Gas (not liquefied)

Refinery gas is defined as non-condensable gas obtained during distillation of crude oil or treatment of oil products (e.g. cracking) in refineries. It consists mainly of hydrogen, methane, ethane and olefins. It also includes gases which are returned from the petrochemical industry. Refinery gas production refers to gross production. Own consumption is shown separately under *petroleum refineries* in the *energy* sector.

2. Liquefied Petroleum Gases (LPG) and Ethane

These are the light hydrocarbons fraction of the paraffin series, derived from refinery processes.

crude oil stabilisation plants and natural gas processing plants comprising propane (C_3H_8) and butane (C_4H_{10}) or a combination of the two. They are normally liquefied under pressure for transportation and storage.

Ethane is a naturally gaseous straight-chain hydrocarbon (C_2H_6). It is a colourless paraffinic gas which is extracted from natural gas and refinery gas streams.

3. Motor Gasoline

This is light hydrocarbon oil for use in internal combustion engines such as motor vehicles, excluding aircraft. Motor gasoline is distilled between 35°C and 215°C and is used as a fuel for land based spark ignition engines. Motor gasoline may include additives, oxygenates and octane enhancers, including lead compounds such as TEL (Tetraethyl lead) and TML (tetramethyl lead).

4. Aviation Gasoline

Aviation gasoline is motor spirit prepared especially for aviation piston engines, with an octane number suited to the engine, a freezing point of -60°C, and a distillation range usually within the limits of 30°C and 180°C.

5. Jet Fuel

This category comprises both gasoline and kerosene type jet fuels meeting specifications for use in aviation turbine power units.

a) Gasoline type jet fuel

This includes all light hydrocarbon oils for use in aviation turbine power units. They distil between 100°C and 250°C. It is obtained by blending kerosenes and gasoline or naphthas in such a way that the aromatic content does not exceed 25 per cent in volume, and the vapour pressure is between 13.7 kPa and 20.6 kPa. Additives can be included to improve fuel stability and combustibility.

b) Kerosene type jet fuel

This is medium distillate used for aviation turbine power units. It has the same distillation characteristics and flash point as kerosene (between 150°C and 300°C but not generally above 250°C). In addition, it has particular specifications (such as freezing point) which are established by the International Air Transport Association (IATA).

6. Kerosene

Kerosene comprises refined petroleum distillate intermediate in volatility between gasoline and gas/diesel oil. It is a medium oil distilling between 150°C and 300°C.

7. Gas/Diesel Oil (Distillate Fuel Oil)

Gas/diesel oil includes heavy gas oils. Gas oils are obtained from the lowest fraction from atmospheric distillation of crude oil, while heavy gas oils are obtained by vacuum redistillation of the residual from atmospheric distillation. Gas/diesel oil distils between 180°C and 380°C. Several grades are available depending on uses: diesel oil for diesel compression ignition (cars, trucks, marine, etc.), light heating oil for industrial and commercial uses, and other gas oil including heavy gas oils which distil between 380°C and 540°C and which are used as petrochemical feedstocks.

8. Heavy Fuel Oil (Residual)

This heading defines oils that make up the distillation residue. It comprises all residual fuel oils, including those obtained by blending. Its kinematic viscosity is above 10 cSt at 80°C. The flash point is always above 50°C and the density is always more than 0.90 kg/l.

9. Naphtha

Naphtha is a feedstock destined either for the petrochemical industry (e.g. ethylene manufacture or aromatics production) or for gasoline production by reforming or isomerisation within the refinery. Naphtha comprises material in the 30°C and 210°C distillation range or part of this range. Naphtha imported for blending is shown as an import of naphtha, then shown in the transfers row as a negative entry for naphtha and a positive entry for the corresponding finished product (e.g. gasoline).

10. Petroleum Coke

Petroleum coke is defined as a black solid residue, obtained mainly by cracking and carbonising of petroleum derived feedstocks, vacuum bottoms, tar and pitches in processes such as delayed coking or fluid coking. It consists mainly of carbon (90 to 95 per cent) and has a low ash content. It is used as a feedstock in coke ovens for the steel industry, for heating purposes, for electrode manufacture and for production of chemicals. The two most important qualities are "green coke" and "calcinated coke".

This category also includes "catalyst coke" deposited on the catalyst during refining processes: this coke is not recoverable and is usually burned as refinery fuel.

11. Other Petroleum Products

The category *other petroleum products* groups together white spirit and SBP, lubricants, bitumen, paraffin waxes and others.

a) White Spirit and SBP:

White spirit and SBP are refined distillate intermediates with a distillation in the naphtha/ kerosene range.

They are sub-divided as:

i) Industrial Spirit (SBP): Light oils distilling between 30°C and 200°C, with a temperature difference between 5 per cent volume and 90 per cent volume distillation points, including losses, of not more than 60°C. In other words, SBP is a light oil of narrower cut than motor spirit. There are 7 or 8 grades of industrial spirit, depending on the position of the cut in the distillation range defined above.

ii) White Spirit: Industrial spirit with a flash point above 30°C. The distillation range of white spirit is 135°C to 200°C.

b) Lubricants:

Lubricants are hydrocarbons produced from distillate or residue; they are mainly used to reduce friction between bearing surfaces. This category includes all finished grades of lubricating oil, from spindle oil to cylinder oil, and those used in greases, including motor oils and all grades of lubricating oil base stocks.

c) Bitumen:

Solid, semi-solid or viscous hydrocarbon with a colloidal structure, being brown to black in colour, obtained as a residue in the distillation of crude oil, vacuum distillation of oil residues from atmospheric distillation. Bitumen is often referred to as asphalt and is primarily used for surfacing of roads and for roofing material. This category includes fluidised and cut back bitumen.

d) Paraffin Waxes:

Saturated aliphatic hydrocarbons (with the general formula C_nH_{2n+2}). These waxes are residues extracted when dewaxing lubricant oils, and they have a crystalline structure with carbon number greater than 12. Their main characteristics are that they are colourless, odourless and translucent, with a melting point above 45°C.

e) Others:

Includes the petroleum products not classified above, for example: tar, sulphur, and grease. This category also includes aromatics (e.g. BTX or benzene, toluene and xylene) and olefins (e.g. propylene) produced within refineries.

D. Gases

The figures for these four categories of gas are all expressed in terajoules based on **gross calorific values**.

1. Natural Gas

Natural gas comprises gases, occurring in underground deposits, whether liquefied or gaseous, consisting mainly of methane. It includes both "non-associated" gas originating from fields producing only hydrocarbons in gaseous form, and "associated" gas produced in association with crude oil as well as methane recovered from coal mines (colliery gas).

Production is measured after purification and extraction of NGL and sulphur, and excludes re-injected gas, quantities vented or flared. It includes gas consumed by gas processing plants and gas transported by pipeline.

2. Gas Works Gas

Gas works gas covers all types of gas produced in public utility or private plants, whose main purpose is the manufacture, transport and distribution of gas. It includes gas produced by carbonisation (including gas produced by coke ovens and transferred to gas works), by total gasification (with or without enrichment with oil products), by cracking of natural gas, and by reforming and simple mixing of gases and/or air. This heading also includes substitute natural gas, which is a high calorific value gas manufactured by chemical conversion of a hydrocarbon fossil fuel.

3. Coke Oven Gas

Coke oven gas is obtained as a by-product of the manufacture of coke oven coke for the production of iron and steel.

4. Blast Furnace Gas

Blast furnace gas is produced during the combustion of coke in blast furnaces in the iron and steel industry. It is recovered and used as a fuel partly within the plant and partly in other steel industry processes or in power stations equipped to burn it. Also included here is oxygen steel furnace gas which is obtained as a by-product of the production of steel in an oxygen furnace and is recovered on leaving the furnace. The gas is also known as converter gas or LD gas or BOS gas.

E. Combustible Renewables and Waste

The figures for these four categories of fuels are all expressed in terajoules based on **net calorific values**.

1. Solid Biomass and Animal Products

Biomass is defined as any plant matter used directly as fuel or converted into other forms before combustion. Included are wood, vegetal waste (including wood waste and crops used for energy production), animal materials/wastes, sulphite lyes, also known as "black liquor" (an alkaline spent liquor from the digesters in the production of sulphate or soda pulp during the manufacture of paper where the energy content derives from the lignin removed from the wood pulp) and other solid biomass.

Charcoal produced from solid biomass is also included here. Since charcoal is a secondary product, its treatment is slightly different than that of the other primary biomass. Production of charcoal (an output in the transformation process) is offset by the inputs of primary biomass into the charcoal production process. The losses from this process are included in the row *other transformation sector*. Other supply (e.g. trade and stock changes) as well as consumption are aggregated directly with the primary biomass. However, in some countries, only the primary biomass is reported. Reported production of charcoal is available separately in the Summary Tables at the end of the publication.

2. Gas/Liquids from Biomass

Biogas is derived principally from the anaerobic fermentation of biomass and solid wastes and combusted to produce heat and/or power. Included in this category are landfill gas and sludge gas (sewage gas and gas from animal slurries) and other biogas. Liquid biomass, which includes bioadditives such as ethanol, is also included in this category.

3. Municipal Waste

Municipal waste consists of products that are combusted directly to produce heat and/or power and comprises wastes produced by the residential, commercial and public services sectors that are collected by local authorities for disposal in a central location. Hospital waste is included in this category.

4. Industrial Waste

Industrial waste consists of solid and liquid products (e.g. tyres) combusted directly, usually in specialised plants, to produce heat and/or power and that are not reported in the category *solid biomass*.

F. Electricity and Heat

1. Electricity

Gross electricity production is measured at the terminals of all alternator sets in a station; it therefore includes the energy taken by station auxiliaries and losses in transformers that are considered integral parts of the station.

The difference between gross and net production is generally calculated as 7 per cent for conventional thermal stations, 1 per cent for hydro stations, and 6 per cent for nuclear, geothermal and solar stations. Hydro stations' production includes production from pumped storage plants.

2. Heat

In recent years, the production of heat for sale has been increasing in importance. To reflect this, heat production represents all heat production from public CHP and heat plants as well as heat sold by autoproducer CHP and heat plants to third parties.

Corresponding fuels to produce quantities of heat for sale are being recorded in the transformation sector under the rows *CHP plants* and *Heat plants*. The use of fuels for heat which is not sold is recorded under the sectors in which the fuel use occurs.

3. Hydro Power

Potential and kinetic energy of water converted into electricity in hydroelectric plants.

4. Geothermal Energy

Energy available as heat emitted from within the earth's crust, usually in the form of hot water or steam. It is exploited at suitable sites:

- for electricity generation using dry stream or high enthalpy brine after flashing;
- directly as heat for district heating, agriculture, etc.

5. Solar Energy

Solar radiation exploited for hot water production and electricity generation, by:

- flat plate collectors, mainly of the thermosyphon type, for domestic hot water or for the seasonal heating of swimming pools;
- photovoltaic cells;
- solar thermal-electric plants.

Passive solar energy for the direct heating, cooling and lighting of dwellings or other buildings is not included.

6. Tide/Wave/Ocean Energy

Mechanical energy derived from tidal movement or wave motion and exploited for electricity generation.

7. Wind Energy

Kinetic energy of wind exploited for electricity generation in wind turbines.

4. NOTES ON SUMMARY TABLES

Production of Charcoal

Charcoal is a secondary biomass product and refers to the solid residue, consisting mainly of carbon, derived from the distillation of wood or other biomass products in the absence of air. Please note that in the Annual Tables, charcoal is included under Solid biomass (Part I.3. Notes on Energy Sources).

Oil Demand by Product, in thousand tonnes and in million barrels per day

Oil demand is defined as the sum of domestic supply, transfers and statistical differences less inputs to refinery, petrochemical industry and liquefaction in the transformation sector, and refineries' own use in the energy sector. *Motor gasoline* includes additives and liquids from biomass.

Other covers crude oil, other hydrocarbons, refinery gas, petroleum coke, white spirit and SBP, lubricants, bitumen, paraffin waxes and others such as tar, sulphur, grease, as well as aromatics (e.g. BTX or benzene, toluene and xylene) and olefins (e.g. propylene) produced within refineries.

Refinery fuel shows petroleum refineries' own use of petroleum fuels for the operation of equipment, heating and lighting, which include mainly refinery gas, gas/diesel oil and heavy fuel oil.

Bunkers shows international marine bunkers consumption of liquid fuels, which include mainly gas/diesel oil and heavy fuel oil.

The following conversion factors are used, in general, for all countries and all years.

Conversion Factors

	Barrels per tonne	
Refinery gas	8.00	
Ethane	16.85	
LPG	11.60	
Naphtha	8.50	(8.90 OECD Europe)
Aviation Gasoline	8.90	
Motor Gasoline	8.53	(8.45 OECD Europe)
Jet Gasoline	7.93	(8.25 OECD)
Jet Kerosene	7.93	(7.88 OECD Europe)
Other Kerosene	7.74	(7.88 OECD Europe)
Gas/Diesel Oil	7.46	
Heavy Fuel Oil	6.66	(6.45 OECD Europe)
White Spirit	7.00	(8.46 OECD)
Lubricants	7.09	
Bitumen	6.08	
Paraffin Waxes	7.00	(7.85 OECD)
Petroleum Coke	5.50	
Non Specified Products	7.00	(8.00 OECD)

Consumption of Electricity

Covers electricity use in transformation, energy sector and final consumption, but excludes distribution losses.

5. GEOGRAPHICAL COVERAGE

Africa includes Algeria, Angola, Benin, Cameroon, Congo, Democratic Republic of Congo, Côte d'Ivoire, Egypt, Eritrea, Ethiopia, Gabon, Ghana, Kenya, Libya, Morocco, Mozambique, Namibia, Nigeria, Senegal, South Africa, Sudan, United Republic of Tanzania, Togo, Tunisia, Zambia, Zimbabwe and **Other Africa**.

Other Africa includes Botswana, Burkina Faso, Burundi, Cape Verde, Central African Republic, Chad, Djibouti, Equatorial Guinea, Gambia, Guinea, Guinea-Bissau, Lesotho, Liberia, Madagascar, Malawi, Mali, Mauritania, Mauritius, Niger, Rwanda, Sao Tome and Principe, Seychelles, Sierra Leone, Somalia, Swaziland and Uganda.

Middle East includes Bahrain, Islamic Republic of Iran, Iraq, Israel, Jordan, Kuwait, Lebanon, Oman, Qatar, Saudi Arabia, Syria, United Arab Emirates and Yemen.

Non-OECD Europe includes Albania, Bosnia and Herzegovina, Bulgaria, Croatia, Cyprus, Gibraltar, Former Yugoslav Republic of Macedonia (FYROM), Malta, Romania, Slovenia and Federal Republic of Yugoslavia.

Former USSR includes Armenia, Azerbaijan, Belarus, Estonia, Georgia, Kazakhstan, Kyrgyzstan, Latvia, Lithuania, Republic of Moldova, Russia, Tajikistan, Turkmenistan, Ukraine and Uzbekistan.

Latin America includes Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, Dominican Republic, Ecuador, El Salvador, Guatemala, Haiti, Honduras, Jamaica, Netherlands Antilles, Nicaragua, Panama, Paraguay, Peru, Trinidad and Tobago, Uruguay, Venezuela and **Other Latin America**.

Other Latin America includes Antigua and Barbuda, Bahamas, Barbados, Belize, Bermuda, Dominica, French Guyana, Grenada, Guadeloupe, Guyana, Martinique, St. Kitts and Nevis, Anguilla, Saint Lucia, St. Vincent and Grenadines and Suriname.

China includes the People's Republic of China and Hong Kong (China).

Asia includes Bangladesh, Brunei, Chinese Taipei, India, Indonesia, DPR of Korea, Malaysia, Myanmar, Nepal, Pakistan, Philippines, Singapore, Sri Lanka, Thailand, Vietnam and **Other Asia**.

Other Asia and Other Oceania includes Afghanistan, Bhutan, Fiji, French Polynesia, Kiribati, Maldives, New Caledonia, Papua New Guinea, Samoa, Solomon Islands and Vanuatu.

The **Organisation for Economic Co-Operation and Development (OECD)** includes Australia, Austria, Belgium, Canada, the Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Japan, Korea, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, the Slovak Republic, Spain, Sweden, Switzerland, Turkey, the United Kingdom and the United States.

Within OECD:

- **Australia** excludes the overseas territories;
- **Denmark** excludes Greenland and the Danish Faroes, except prior to 1990, where data on oil for Greenland are in included with the Danish statistics;
- **France** includes Monaco, and excludes overseas departments (French Polynesia,

Guadeloupe, Guyane, Martinique, Nouvelle-Calédonie, La Réunion and St.-Pierre et Miquelon);

- **Germany** includes the new federal states of Germany;
- **Italy** includes San Marino and the Vatican;
- **Japan** includes Okinawa;
- **The Netherlands** excludes Suriname and the Netherlands Antilles;
- **Portugal** includes the Azores and Madeira;
- **Spain** includes the Canary Islands;
- **Switzerland** includes Liechtenstein;
- **United States** includes Puerto Rico, Guam, the Virgin Islands and the Hawaiian Free Trade Zone.

The Organisation of the Petroleum Exporting Countries (OPEC) includes Algeria, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates and Venezuela.

Please note that the following countries have not been considered due to lack of data:

- **Africa:** Comoros, Saint Helena and Western Sahara;
- **America:** Aruba, British Virgin Islands, Cayman Islands, Falkland Islands, Montserrat, Saint Pierre-Miquelon and Turks and Caicos Islands;
- **Asia and Oceania:** American Samoa, Cambodia, Christmas Island, Cook Islands, Laos, Macau, Mongolia, Nauru, Niue, Palau, Tonga and Wake Island.

Note:

- The OLADE database was used for some of the Latin American countries.
- For the period 1971 to 1998, the UN database was the only source of information for the countries which are not listed below, and for the regions Other Africa, Other Latin America and Other Asia and Oceania. It was also used in a number of other countries as a complementary source. This is also the case for the years that are not shown in the country notes below.

World Development Indicators 2002 on CD-ROM, The World Bank, Washington, 2002.

Albania

Large quantities of oil widely reported to have moved through Albania into former Yugoslavia may not be included in oil trade for 1993. Although estimated to represent up to 100 per cent of underlying domestic consumption, no reliable figures for this trade were available.

People's Republic of China

See Part I.1, Issues of Data Quality above.

Coal production statistics refer to unwashed and unscreened coal. IEA coal statistics normally refer to coal after washing and screening for the removal of inorganic matter.

Since 1997, Chinese coal production has been declining for several reasons. Among these are: a switch to higher quality coal, implementation of environmental regulations - especially in urban areas, changes in economic structure, new fuel mix policies in power generation, shutdown of thousands of small mines and the strict implementation of state supported energy efficiency policies. However, analyses of original Chinese coal production and consumption data show that the drop in production is much more significant than the drop in consumption which creates very big statistical differences after 1997. Based upon the assumption that coal consumption statistics are more reliable than coal production statistics, that the production-consumption relationship should maintain a better balance over time, that changes in the number of miners working in the coal mines and coal productivity trends reflect higher production; the IEA has revised Chinese coal production statistics upward. It should be noted that these data are IEA estimates and in no case represent official data released by the Chinese government.

Moreover, the IEA has adjusted the sectoral breakdown of energy consumption in line with the IEA methodology from 1990 onwards.

Former USSR

Coal production statistics refer to unwashed and unscreened coal up to 1992. IEA coal statistics normally refer to coal after washing and screening for the removal of inorganic matter. Also see notes under 'Classification of Fuel Uses' and 'Heat', above.

The energy balances presented for the former USSR include Secretariat estimates of fuel consumption in the main categories of transformation. These estimates are based on secondary sources and on isolated references in FSU literature.

Summary tables, commodity and energy balance tables for former USR are now the sum of individual former USSR republics after 1992. In previous editions of this publication, intra-USSR trade was excluded and average net calorific values were applied to the aggregate data instead of the country-specific factors. This is also the case for "Former Yugoslavia".

Federal Republic of Yugoslavia

Sources 1998-2000:

Direct communication to the Secretariat from the Federal Ministry of Economy, Beograd, January 2001, March 2002.

Former Yugoslavia

From 1992 onwards, the energy balance for former Yugoslavia has been prepared by adding together the basic statistics of its component countries: Croatia, Slovenia, Former Yugoslav Republic of Macedonia, Bosnia-Herzegovina, and the Federal Republic of Yugoslavia. In the case of the latter two, the quality of data beyond basic production flows is questionable. Oil imports into Former Yugoslavia, breaking the UN embargo of Serbia & Montenegro are theoretically included, although the absolute levels of this trade are not known with any certainty. As such the balance for former Yugoslavia should be seen as an estimation that is necessary for completing regional aggregates.

Other Africa, Other Latin America, and Other Asia and Oceania

The series for these 'sum' countries are made up by simple addition of their component countries. Intra-component country trade is therefore included as part of total trade, although to truly represent trade to and from the grouping, intra-component country movements should be discounted. Trade is therefore likely to be overstated.

1. DE LA QUALITE DES DONNEES

A. Méthodologie

Des efforts considérables ont été déployés pour veiller à ce que les données présentées dans cette publication correspondent aux définitions de l'AIE figurant dans les Notes générales (parties I.2 et 3). Ces définitions sont utilisées par la plupart des organisations internationales qui recueillent des statistiques sur l'énergie. Toutefois, les statistiques nationales sur l'énergie communiquées à ces organisations sont souvent fondées sur des critères et définitions qui diffèrent, parfois sensiblement, de ceux qu'elles emploient. On trouvera ci-après des informations sur les différences repérées par le Secrétariat de l'AIE et sur les ajustements qu'il a pu, le cas échéant, opérer pour faire correspondre les données aux définitions internationales. Les différences notoires relevées dans certains pays sont signalées dans la partie I.6, Notes et sources par pays. Les notes par pays indiquent seulement quelques-unes des déviations les plus importantes et les plus évidentes constatées dans certains pays par rapport à la méthodologie de l'AIE, et ne constituent en aucun cas une liste exhaustive des différences et anomalies par pays.

B. Estimation

Outre les ajustements opérés pour compenser les différences de définition, des estimations se révèlent parfois nécessaires pour compléter certains agrégats importants pour lesquels il manque des statistiques essentielles. On en trouvera des exemples dans les notes plus détaillées proposées ci-dessous. Sauf en ce qui concerne les énergies combustibles renouvelables et les déchets (voir plus loin E.5), le Secrétariat s'est attaché à fournir tous les éléments des bilans par produit jusqu'à la consommation finale pour tous les pays et toutes les années. Il a fallu pour cela indiquer les éléments de l'offre ainsi que les entrées de combustibles primaires et les sorties de combustibles secondaires correspondant aux principales activités de transformation telles que le raffinage du pétrole et la production d'électricité. Des estimations ont souvent dû être établies, après consultation d'offices statistiques nationaux, de compagnies pétrolières, de compagnies d'électricité et d'experts nationaux en matière d'énergie.

C. Séries chronologiques et changements politiques

Les bilans par produit des républiques de l'ex-URSS ont été établis à partir de 1992. Ces bilans ont été établis à l'aide de données officielles et, lorsque cela a été nécessaire, des estimations ont été effectuées à partir de données obtenues auprès de diverses industries et d'autres organisations internationales. Il est à noter que les tableaux récapitulatifs et les bilans par produit de la région "ex-URSS" sont la somme des pays individuels de l'ex-URSS. Ceci est aussi le cas pour l'"ex-Yougoslavie".

Les statistiques énergétiques de certains pays ont subi diverses modifications soit au niveau des données prises en compte soit de la méthodologie utilisée. En conséquence, certaines "ruptures de séries" apparaissent inévitables.

Le Secrétariat de l'AIE réexamine ses bases de données chaque année. A la lumière des nouvelles évaluations, d'importantes révisions sont apportées aux séries chronologiques des pays au cours de cet examen. En conséquence, certaines données de la présente publication ont été sensiblement révisées par rapport aux précédentes éditions. Veuillez vous référer aux notes relatives des différents pays.

D. Classification des utilisations des combustibles

Les sources statistiques nationales manquent souvent d'informations adéquates concernant la consommation de combustibles suivant les différentes catégories d'utilisations finales. Beaucoup de pays ne font pas d'enquêtes annuelles de la consommation de combustibles dans les principaux secteurs de l'économie, c'est pourquoi les données publiées sont fondées sur des enquêtes anciennes. La ventilation par secteurs de la consommation dans les différents pays doit donc être interprétée avec prudence.

Avant les réformes entreprises dans les années 1990, la classification sectorielle de la consommation de combustibles dans les économies en transition (d'Europe de l'Est et de l'ex-URSS) et en Chine était très différente de celle pratiquée dans les économies de marché. La consommation sectorielle était définie d'après la branche de l'économie à laquelle appartenait l'utilisateur du combustible et non d'après la vocation ou l'usage du combustible. Par exemple, la consommation d'essence des véhicules d'une entreprise appartenant au secteur de la sidérurgie faisait partie de la consommation industrielle d'essence du secteur de la sidérurgie. Les données ont été ajustées dans la mesure du possible pour correspondre aux classifications internationales: par exemple, la totalité de la consommation d'essence est supposée relever du secteur des transports et est reportée comme telle dans la présente publication. Cependant, il n'a pas été possible de reclasser tous les produits aussi facilement que l'essence et le carburéacteur, et peu d'ajustements ont été opérés sur les autres produits.

E. Problèmes particuliers par combustible

1. Pétrole

Le Secrétariat de l'AIE recueille des statistiques très complètes concernant l'offre et la consommation de pétrole, y compris l'autoconsommation des raffineries, les soutages maritimes et le pétrole utilisé en pétrochimie. Les statistiques nationales font rarement état de ces chiffres. La production indiquée de produits raffinés correspond souvent à la production nette, et non brute, des raffineries et la consommation de produits pétroliers se limite parfois aux ventes sur les marchés intérieurs et ne comprend pas les livraisons aux transports internationaux maritimes ou aériens. Le pétrole utilisé comme produit de base en pétrochimie dans des complexes intégrés de raffinage/pétrochimie n'est souvent pas comptabilisé dans les statistiques officielles disponibles.

Lorsque cela est possible, le Secrétariat procède, en consultation avec l'industrie pétrolière, à une estimation des données non communiquées. En l'absence de toute autre indication sur l'utilisation de combustibles par les raffineries, la consommation des raffineries a été estimée à environ 5 pour cent des entrées en raffinerie et divisée à parts égales entre le gaz de raffinerie et le fioul lourd.

Pour une description des ajustements apportés à la consommation sectorielle de produits pétroliers, se reporter au paragraphe ci-devant intitulé "Classification des utilisations des combustibles".

2. Gaz naturel

L'AIE définit la production de gaz naturel comme la production commercialisable, c'est-à-dire nette des pertes à l'extraction et des quantités brûlées à la torchère, rejetées et réinjectées. De plus, le gaz naturel doit être constitué essentiellement de méthane, et les autres gaz tels que l'éthane et les hydrocarbures à chaîne plus longue doivent être comptabilisés dans la rubrique "pétrole".

Toutefois, les données directement disponibles sur le gaz naturel n'indiquent souvent pas le détail des pertes à l'extraction ainsi que des quantités brûlées à la torchère, rejetées et réinjectées. Les données communiquées sont rarement accompagnées de

définitions adéquates, c'est pourquoi il est difficile, voire impossible, d'identifier le gaz aux différents stades de sa séparation en gaz sec (méthane) et en fractions plus lourdes dans les installations de séparation.

Les statistiques concernant l'offre et la demande de gaz naturel sont généralement exprimées en unités de volume et il est difficile d'obtenir des données précises sur le pouvoir calorifique du gaz. Lorsque ce chiffre n'est pas connu, un pouvoir calorifique supérieur de 38 TJ/million de m^3 a été appliqué.

Signalons par ailleurs qu'il est souvent difficile d'obtenir des données fiables sur la ventilation de la consommation de gaz naturel. Cette constatation s'applique tout particulièrement à certains des plus grands pays consommateurs de gaz naturel du Moyen-Orient. Pour cette raison, la consommation industrielle de gaz naturel de ces pays n'est souvent pas indiquée dans les données figurant dans la présente publication.

3. Electricité

Comme l'indiquent les Notes générales (partie I.2), on appelle autoproducteur d'électricité une entreprise qui, en plus de ses activités principales, produit de l'énergie électrique destinée en totalité ou en partie à couvrir ses besoins propres. Les pays non membres de l'OCDE disposent rarement de données répondant à cette définition. Pour ces pays, les entrées de combustibles correspondant à l'autoproduction d'électricité sont indiquées dans la rubrique utilisation finale industrielle.

Lorsqu'il existe des statistiques concernant la production d'électricité à partir d'énergies Renouvelables Combustibles et de Déchets, elles sont inclues dans la production totale d'électricité. Ces données ne sont pas complètes : par exemple, l'électricité produite à partir des déchets végétaux des sucreries n'est généralement pas indiquée.

Les entrées de combustibles utilisés pour produire de l'électricité sont estimées (lorsqu'elles ne sont pas communiquées) à l'aide de données sur la production d'électricité, le rendement énergétique et le type d'installation de production.

4. Chaleur

Les économies en transition (d'Europe de l'Est et de l'ex-URSS) et la Chine utilisaient, s'agissant de la chaleur, une méthodologie qui les démarquait des pratiques communément adoptées dans les économies de marché. Cette méthodologie consistait à comptabiliser la transformation par l'industrie de combustibles primaires (charbon, pétrole et gaz) en chaleur destinée à la *consommation sur place* dans l'activité de transformation production de chaleur et non dans la consommation industrielle, comme le prévoit la méthodologie de l'AIE[1] : la production de chaleur était ensuite répartie entre les différents secteurs d'utilisation finale. Les pertes survenant pendant la transformation des combustibles en chaleur par l'industrie n'étaient pas comptabilisées dans la consommation industrielle finale. Bien que plusieurs pays aient récemment adopté la pratique des organisations internationales, cette différence non négligeable limite la validité des comparaisons entre les pays en transition et les économies de marché pour ce qui est de la consommation finale par secteur.

5. Energies renouvelables combustibles et déchets

L'AIE publie les données de production et d'approvisionnement intérieur en énergies renouvelables combustibles et en déchets de tous les pays non-membres de l'OCDE et toutes les régions pour les années 1974 à 2000 (1971 à 2000 sur CD-ROM).

Ces données proviennent souvent de sources secondaires, elles ne sont pas harmonisées et leur qualité est douteuse, ce qui rend difficile les comparaisons entre les pays. Les données historiques de nombreux pays proviennent d'enquêtes souvent irrégulières, non harmonisées et menées à un niveau local plutôt que national. Elles ne sont donc comparables ni entre régions ni dans le temps. Lorsque des séries chronologiques étaient incomplètes ou non disponibles, le Secrétariat a procédé à l'estimation des données selon une méthodologie compatible avec le cadre prévisionnel de l'édition 1998 de l'ouvrage de l'AIE intitulé *World Energy Outlook* (septembre 1998). Premièrement, l'approvisionnement intérieur par habitant de biomasse et de déchets a été calculé ou estimé pour 1995. Deuxièmement, l'approvisionnement par habitant a été estimé pour les années 1971 à 1994 en utilisant une équation log/log avec comme variable exogène soit le PIB par

1 La méthodologie internationale ne comptabilise la chaleur dans le secteur de transformation que dans la mesure où elle est vendue à des tiers. Voir la définition dans la partie I.2.

habitant, soit le taux d'urbanisation, selon la région. Troisièmement, l'approvisionnement total de biomasse et de déchets après 1996 a été estimé en supposant un taux de croissance soit constant, soit égal à la croissance de la population, soit conforme à l'estimation sur la période 1971-1994. Cependant, ces séries historiques estimées doivent être traitées avec prudence.

Le tableau ci-dessous fournit des indications sommaires sur la qualité des données et la méthode d'estimation par région.

Région	Principales sources de données	Qualité des données	Variable exogène
Afrique	base de données FAO et BAfD	Faible	taux d'urbanisation
Amérique latine	nationales et OLADE	Élevée	aucune
Asie	enquêtes	Élevée à faible	PIB per habitant
Europe non-OCDE	questionnaires et FAO	Élevée à moyenne	aucune
ex-USSR	nationales et questionnaires et FAO	Élevée à moyenne	aucune
Moyen-Orient	FAO	Moyenne à faible	aucune

Bien qu'un soin tout particulier ait été apporté à la compatibilité des estimations avec celles réalisées dans la partie biomasse du *World Energy Outlook 2002*, des différences mineures subsistent pour certaines raisons. Parmi ces raisons, il convient de souligner des révisions plus tardives des données utilisées ainsi que des niveaux différents de désagrégations par pays.

Pour les années 1994 à 2000, tous les éléments des bilans jusqu'à la consommation par usage ont été compilés par produit ou catégorie de produits pour tous les pays. Les données pour les années 1999 et 2000 sont fournies dans les Tableaux annuels. La production de charbon de bois est fournie dans les Tableaux récapitulatifs. Les valeurs confirment l'importance des énergies d'origine végétale dans le secteur énergétique de nombreux pays en voie de développement.

L'AIE espère que l'inclusion de ces données encouragera les administrations et les autres agences spécialisées à améliorer la qualité et étendre la couverture de la collecte des données. Plus de détails sur la méthode suivie par pays peuvent être obtenus sur demande, et les commentaires sont bienvenus.

2. NOTES GENERALES

Les tableaux couvrent l'ensemble des sources "commerciales" d'énergie, c'est-à-dire à la fois les sources primaires (houille, lignite, tourbe, gaz naturel, pétrole brut, liquides de gaz naturel (LGN) et énergies hydrauliques, géothermique/solaire, éolienne, marémotrice, etc. ainsi que l'énergie nucléaire) et les sources secondaires (dérivés du charbon, gaz manufacturés, produits pétroliers, électricité et chaleur). Des données sont également indiquées pour diverses sources d'énergies renouvelables combustibles et de déchets, telles que la biomasse solide, les liquides tirés de la biomasse, les déchets urbains et les déchets industriels.

Chaque tableau est divisé en trois parties principales: la première récapitulant les éléments de *l'approvisionnement*; la deuxième faisant état des secteurs *transformation* et *énergie*; et la troisième indiquant la *consommation finale* ventilée entre les divers secteurs d'utilisation finale.

La description ci-dessus concerne les bilans par produit complets. Dans le cas des bilans régionaux et des bilans agrégés les définitions des produits sont les mêmes que pour les bilans complets. Cependant, la ventilation par secteur est réduite aux principaux totaux (secteur énergie, etc.) et à des catégories de consommation choisies (sidérurgie, etc.).

A. Approvisionnement

La première partie du bilan énergétique de base fournit les éléments suivants de l'approvisionnement:

Production
\+ *Apports d'autres sources*
\+ *Importations*
\- *Exportations*
\- *Soutages maritimes internationaux*
± *Variations des stocks*
= *Approvisionnement intérieur*

1. Production

La *production* comprend les quantités de combustibles extraites ou produites, après extraction des matières inertes ou des impuretés (par exemple, après extraction du soufre contenu dans le gaz naturel).

2. Apports d'autres sources

La rubrique *apports d'autres sources* couvre tous les apports de produits dont l'origine ne correspond pas explicitement aux définitions des sources d'énergie primaire figurant dans les tableaux ; par exemple, pour la catégorie pétrole brut : les produits provenant d'autres sources que le pétrole brut ou les LGN, comme l'hydrogène, le pétrole brut de synthèse (y compris les huiles minérales extraites de minéraux bitumineux tels que les schistes, les sables asphaltiques, etc.) ; pour les additifs : le benzol, l'alcool et le méthanol produits à partir du gaz naturel ; pour les produits d'alimentation des raffineries : les quantités renvoyées par l'industrie pétrochimique et utilisées comme produits d'alimentation des raffineries ; pour la houille : les schlamms et les mixtes, la poussière récupérée et d'autres produits charbonniers de basse qualité, qui ne sont pas classables d'après le type de charbon d'origine ; pour le gaz d'usine à gaz : le gaz naturel, le gaz de raffinerie et le GPL, traités ou mélangés dans les usines à gaz (c'est-à-dire, gaz d'usine à gaz produit à partir d'autres sources que le charbon).

3. Importations et exportations

La rubrique *importations* et *exportations* désigne les quantités de produits ayant franchi les frontières du territoire national, que le dédouanement ait été effectué ou non.

a) Charbon

Les *importations* et *exportations* comprennent les quantités de combustibles obtenues d'autres pays ou fournies à d'autres pays, qu'il existe ou non une union économique ou douanière entre les pays en question. Le charbon en transit n'est pas pris en compte.

b) Pétrole et gaz

Cette rubrique comprend les quantités de pétrole brut et de produits pétroliers importées ou exportées au titre d'accords de traitement (à savoir, raffinage à façon). Les quantités de pétrole en transit ne sont pas prises en compte. Le pétrole brut, les LGN et le gaz naturel sont répertoriés en fonction de leur pays d'origine. Pour les produits d'alimentation des raffineries et les produits pétroliers, en revanche, c'est le dernier pays de provenance qui est pris en compte.

Les réexportations de pétrole importé pour raffinage en zone franche sont comptabilisées dans les exportations de produits pétroliers par le pays de raffinage vers le pays de destination finale.

c) Electricité

Les quantités sont considérées comme importées ou exportées lorsqu'elles ont franchi les limites territoriales du pays. Si l'électricité transite par un pays le montant correspondant est inclu à la fois dans les importations et les exportations.

4. Soutages maritimes internationaux

Les *soutages maritimes internationaux* correspondent aux quantités fournies aux navires de haute mer, y compris les navires de guerre, quel que soit leur pavillon. La consommation des navires assurant le transport par cabotage ou navigation intérieure et des navires de pêche n'est pas comprise. Voir ci-dessous les définitions des secteurs des transports (section 2.C.2) et de l'agriculture (section 2.C.3).

5. Variations des stocks

Les *variations des stocks* expriment la différence enregistrée entre le premier jour et le dernier jour de l'année dans le niveau des stocks détenus sur le territoire national par les producteurs, les importateurs, les entreprises de transformation de l'énergie et les gros consommateurs. Les variations des quantités de pétrole et de gaz stockées dans les oléoducs et les gazoducs ne sont pas prises en compte. Sauf chez les gros consommateurs susmentionnés, les variations des stocks des utilisateurs finals ne sont pas comptabilisées. Une augmentation des stocks est indiquée par un chiffre négatif, tandis qu'une diminution apparaît sous la forme d'un chiffre positif.

6. Approvisionnement intérieur

L'*approvisionnement intérieur* est ainsi défini : production + apports d'autres sources + importations - exportations - soutages maritimes internationaux ± variations des stocks.

7. Transferts

La rubrique *transferts* comprend les lignes *transferts entre produits*, *produits transférés* et *produits recyclés*.

Les *transferts entre produits* visent les produits dont le classement a changé soit parce que leurs spécifications ont été modifiées soit parce qu'ils ont été mélangés pour former un autre produit. Ainsi, le kérosène peut être reclassé comme gazole après mélange avec ce dernier produit pour obtenir un gazole conforme aux spécifications hivernales. Le solde net des *transferts entre produits* est nul.

Les *produits transférés* sont des produits pétroliers importés pour subir un traitement complémentaire dans des raffineries. Par exemple : le fioul importé pour conversion dans une raffinerie est transféré dans la catégorie des produits d'alimentation.

Les *produits recyclés* sont des produits finis qui sont remis dans le circuit commercial, **après** avoir été livrés une première fois au consommateur final (par exemple les lubrifiants usés qui sont régénérés).

8. Ecarts statistiques

L'écart statistique est défini comme les livraisons destinées à la consommation finale + les quantités utilisées pour la transformation et la consommation

dans le secteur de l'énergie + les pertes de distribution – l'approvisionnement intérieur – les transferts. En effet, les écarts statistiques proviennent des données relatives aux différentes composantes de l'approvisionnement qui sont souvent tirées par l'administration nationale de sources différentes. En outre, la prise en compte des variations des stocks de certains gros consommateurs dans la partie approvisionnement du bilan crée des distorsions qui contribuent aux écarts statistiques.

B. Secteurs transformation et énergie

Le *secteur transformation* englobe les activités de transformation des formes d'énergie primaire en énergie secondaire, et de transformation ultérieure (par exemple, celle du charbon à coke en coke, du pétrole brut en produits pétroliers, du fioul lourd en électricité).

Le *secteur énergie* englobe les quantités de combustibles utilisées par les industries productrices d'énergie (par exemple, pour le chauffage, l'éclairage et le fonctionnement de tous les équipements intervenant dans le processus d'extraction, ou encore pour la traction et la distribution).

Dans les secteurs *transformation* et *énergie* on distingue les catégories suivantes :

1. Secteur Transformation

- *Centrales électriques* (désigne les centrales conçues pour produire uniquement de l'électricité). Si une unité ou plus de la centrale est une installation de cogénération (et que l'on ne peut pas comptabiliser séparément, sur une base unitaire, les combustibles utilisés et la production), elle est considérée comme une centrale de cogénération. Tant les centrales publiques[2] que les installations des autoproducteurs[3] entrent dans cette rubrique.

- *Centrales de cogénération chaleur/électricité* (désigne les centrales conçues pour produire de la chaleur et de l'électricité). L'UNIPEDE les appelle "installations de production combinée d'énergie électrique et de chaleur". Dans la mesure du possible, les consommations de combustibles et les productions de chaleur/électricité doivent être exprimées sur la base des unités plutôt que des centrales. Cependant, à défaut de données disponibles exprimées sur une base unitaire, il convient d'adopter la convention indiquée ci-dessus pour la définition d'une centrale de cogénération. *On notera que, dans le cas des installations de cogénération chaleur/électricité des autoproducteurs, sont comptabilisés tous les combustibles utilisés pour la production d'électricité, tandis que seule la partie des combustibles utilisés pour la production de chaleur* ***vendue*** *est indiquée. Les combustibles utilisés pour la production de la chaleur destinée à la consommation interne des autoproducteurs* ***ne sont pas*** *comptabilisés dans cette rubrique mais dans les données concernant la consommation finale de combustibles du secteur de consommation approprié.*

- *Centrales calogènes* (désigne les installations [pompes à chaleur et chaudières électriques comprises] conçues pour produire uniquement de la chaleur et qui en vendent à des tiers [par exemple, consommateurs des secteurs résidentiels, commerciaux ou industriels] selon les termes d'un contrat). Cette rubrique comprend aussi bien les centrales publiques que les installations des autoproducteurs.

- *Hauts-fourneaux et Usines à gaz* (couvrant les quantités de combustibles utilisées pour la production de gaz de ville, de gaz de haut fourneau et de gaz de convertisseur à oxygène). Dans la production de fonte brute à partir de minerai de fer dans les hauts-fourneaux, les combustibles sont utilisés pour la charge des hauts-fourneaux et pour l'apport de chaleur et de carbone nécessaire à la réduction du minerai. Comptabiliser le pouvoir calorifique des combustibles qui entrent dans ce procédé est une tâche complexe, car la transformation (en

2 La production publique désigne les installations dont la *principale activité* est la production d'électricité et/ou de chaleur pour la vente à des tiers. Elles peuvent appartenir au secteur privé ou public. Il convient de noter que les ventes ne se font pas nécessairement par l'intermédiaire du réseau public.

3 L'autoproduction désigne les installations qui produisent de l'électricité et/ou de la chaleur, en totalité ou en partie pour leur consommation propre, en tant qu'activité qui contribue à leur activité principale. Elles peuvent appartenir au secteur privé ou public.

gaz de haut fourneau) et la consommation (de chaleur de combustion) interviennent simultanément. Il se produit aussi une rétention de carbone dans la fonte brute; la quasi-totalité de ce carbone réapparaît ultérieurement dans le gaz de convertisseur à oxygène (appelé aussi gaz de convertisseur ou gaz LD) lorsque la fonte brute est transformée en acier. En principe, les quantités de tous les combustibles (par exemple, charbon utilisé pour l'injection de charbon pulvérisé, coke de four à coke, gaz naturel et fioul) entrant dans les hauts-fourneaux et la quantité de gaz de haut fourneau et gaz de convertisseur à oxygène produite sont recueillies. Cependant, à l'exception des entrées de coke de four, les données sont souvent douteuses ou incomplètes. Le Secrétariat doit répartir ces apports entre les secteurs de transformation et de consommation. L'élément correspondant à la transformation est indiqué dans la ligne *hauts-fourneaux et usines à gaz* à la colonne appropriée pour le combustible dont il s'agit, et l'élément correspondant à la consommation est indiqué dans la ligne *sidérurgie*, à la consommation finale, à la colonne appropriée pour le combustible dont il s'agit. Avec la présente publication, le Secrétariat a décidé de supposer une ventilation des entrées de coke de four de 80% et 20% respectivement entre les secteurs de transformation et de consommation. Le résultat de ce changement, par rapport aux éditions précédentes, est une augmentation de la quantité d'énergie entrant à la ligne *hauts-fourneaux et usines à gaz* et une diminution à la ligne *sidérurgie*. Cette ventilation a été estimée à partir des résultats du modèle appliqué aux pays de l'OCDE.[4] Elle fournit un équilibrage plus cohérent entre les entrées de carbone dans les hauts fourneaux et les sorties correspondantes, lorsque les données de l'AIE sont utilisées pour calculer les émissions de CO_2 dues à la combustion, en utilisant la méthodologie du Groupe d'experts intergouvernemental sur l'évolution du climat (GIEC) telle qu'elle est publiée dans *Lignes directrices révisées en 1996 du GIEC pour les inventaires nationaux de gaz à effet de serre*[5].

- *Cokeries/Fabriques d'agglomérés/Fabriques de briquettes de lignite* (couvrant les combustibles utilisés pour la production de coke, de gaz de cokerie, d'agglomérés et de briquettes de lignite [BKB]).
- *Raffineries de pétrole* (couvrant les hydrocarbures utilisés pour la production de produits pétroliers finis).
- *Industrie pétrochimique* (couvrant les produits renvoyés aux raffineries par l'industrie pétrochimique). Il convient de noter que les retours en raffinerie des produits pétroliers utilisés à des fins non énergétiques (i.e. white spirit et lubrifiants) ne sont pas inclus sous cette rubrique, mais sous utilisations non énergétiques.
- Les unités de *liquéfaction* (comprenant divers procédés de liquéfaction, notamment la liquéfaction de charbon et de gaz naturel en Afrique du Sud).
- *Secteur transformation - autres* (comprenant la transformation de la biomasse solide en charbon de bois et les autres transformations non spécifiées).

2. Secteur énergie

La consommation propre du secteur de la production d'énergie comprend l'énergie consommée par les industries de transformation pour la chauffe, le pompage, la traction et l'éclairage [Divisions 10, 11, 12, 23 et 40 de la CITI[6]] :

- *mines de charbon* (houille et lignite) ;
- *extraction de pétrole et de gaz* (le gaz brûlé à la torche n'est pas compris) ;
- *raffineries de pétrole* ;
- *centrales électriques, centrales de cogénération et centrales calogènes* ;
- *énergie absorbée par le pompage* (électricité consommée dans les centrales hydrauliques) ;

4 Voir *Statistiques de l'énergie des pays de l'OCDE* pour plus d'informations sur le modèle d'estimation des hauts fourneaux appliqué aux pays de l'OCDE.

5 La publication *Lignes directrices révisées en 1996 du GIEC pour les inventaires nationaux de gaz à effet de serre* est disponible auprès du Programme du GIEC sur les inventaires de gaz à effet de serre à http://www.ipcc-nggip.iges.or.jp.

6 Classification internationale type par industrie de toutes les branches d'activité économique, Série M, No. 4/Rév. 3, Nations Unies, New York, 1990.

- *secteur énergie-autres* (comprenant la consommation propre des fabriques d'agglomérés, des cokeries, des usines à gaz, des hauts fourneaux, des fabriques de briquettes et de coke de lignite, des unités de liquéfaction, des unités de gazéifaction, des unités de production de charbon de bois, des centrales nucléaires ainsi que les utilisations non spécifiées du secteur énergie).

3. Pertes de distribution

Les *pertes de distribution* incluent les pertes enregistrées lors de la distribution du gaz, du transport de l'électricité et du transport du charbon. Peut également inclure des usages non comptabilisés de pétrole brut et de produits pétroliers.

C. Consommation finale

Le terme *consommation finale* (qui correspond à la somme des consommations des secteurs d'utilisation finale) signifie que l'énergie utilisée pour la transformation et pour la consommation propre des industries productrices d'énergie est exclue. La consommation finale recouvre la majeure partie des livraisons aux consommateurs (voir la note sur les variations des stocks à la section 2.A.5).

Dans la consommation finale, les produits d'alimentation de l'industrie pétrochimique sont inclus dans le secteur **industrie** dans une sous-catégorie de la rubrique *industrie chimique* pour les produits pétroliers qui sont utilisés essentiellement à des fins énergétiques. En revanche, les produits pétroliers qui sont principalement utilisés à des fins non énergétiques (voir utilisations non énergétiques à la section 2.C.4), sont indiqués sous les rubriques *utilisations non énergétiques* et inclus uniquement dans la **consommation finale totale**. Les retours de produits de l'industrie pétrochimique ne sont pas pris en compte dans la consommation finale (voir les sections 2.A.2 et 2.B.1).

1. Secteur industrie

La consommation du *secteur industrie* est répartie entre les sous-secteurs suivants (l'énergie utilisée par l'industrie pour le transport n'est pas prise en compte ici mais figure dans la rubrique transports) :

- *Sidérurgie* [Groupe 271 et Classe 2731 de la CITI] ;
- *Industrie chimique* [Division 24 de la CITI] ; *dont* : produits d'alimentation de l'industrie pétrochimique. L'industrie pétrochimique comprend les opérations de craquage et de reformage destinées à la production de l'éthylène, du propylène, du butylène, du gaz de synthèse, des aromatiques, du butadiène et d'autres matières premières à base d'hydrocarbures [partie du Groupe 241 de la CITI] ; voir produits d'alimentation, dans la section 2.C.4 (Utilisations non énergétiques) ;
- Industries de base des *métaux non ferreux* [Groupe 272 et Classe 2732 de la CITI] ;
- *Produits minéraux non métalliques* tels que verre, céramiques, ciment, etc. [Division 26 de la CITI] ;
- *Matériel de transport* [Divisions 34 et 35 de la CITI] ;
- *Construction mécanique.* Fabrication d'ouvrages en métaux, de machines et de matériels à l'exclusion du matériel de transport [Divisions 28, 29, 30, 31 et 32 de la CITI] ;
- *Industries extractives (à l'exception des combustibles)* [Divisions 13 et 14 de la CITI] ;
- *Industrie alimentaire et tabacs* [Divisions 15 et 16 de la CITI] ;
- *Papier, pâte à papier et imprimerie* [Divisions 21 et 22 de la CITI] ;
- *Bois et produits dérivés* (à exclusion de la pâte à papier et du papier) [Division 20 de la CITI] ;
- *Construction* [Division 45 de la CITI] ;
- *Textiles et cuir* [Divisions 17, 18 et 19 de la CITI] ;
- *Non spécifiés* (tout autre secteur industriel non spécifié précédemment) [Divisions 25, 33, 36 et 37 de la CITI].

Note : La plupart des pays éprouvent des difficultés pour fournir une ventilation par branche d'activité pour tous les combustibles. Dans ces cas, la rubrique *non spécifiés* a été utilisée. *Les agrégats régionaux de la consommation industrielle doivent donc être employés avec précaution.*

2. Secteur transports

La consommation dans le *secteur transports* couvre toutes les activités de transport (liées à des moteurs mobiles) quel que soit le secteur économique concerné [Divisions 60, 61 et 62 de la CITI], et elle est ventilée entre les différents sous-secteurs suivants :

- *Transport aérien* : Livraisons de carburants aviation à l'aviation civile internationale et pour toutes les activités de transport aérien intérieur, à savoir commerciales, privées, agricoles, militaires, etc. Comprend également les quantités utilisées à des fins autres que le vol proprement dit, par exemple, l'essai de moteurs au banc, mais non le carburant utilisé par les compagnies aériennes pour le transport routier ;
- *Transport routier* : La totalité des carburants utilisés dans les véhicules routiers (militaires compris) ainsi que le carburant consommé par les transports agricoles et industriels sur route. Ne tient pas compte de l'essence moteur employée dans les moteurs fixes, ni du gazole utilisé par les tracteurs ailleurs que sur route ;
- *Transport ferroviaire* : Toutes les quantités utilisées par le trafic ferroviaire, y compris par les chemins de fer industriels ;
- *Transport par conduites* : L'énergie utilisée pour le transport de substances par conduites ;
- *Navigation intérieure* (y compris la consommation des petites embarcations et des bateaux de cabotage n'achetant pas leur soutage aux termes de contrats de soutages maritimes internationaux). Le carburant utilisé pour la pêche en haute mer, le long du littoral et dans les eaux intérieures doit être comptabilisé dans le secteur agriculture ;
- *Non spécifiés*.

3. Autres secteurs

- *Agriculture* : Cette rubrique couvre, par définition, toutes les livraisons aux usagers classés dans les rubriques agriculture, chasse et sylviculture de la CITI, et comprend donc les produits énergétiques consommés par ces usagers que ce soit pour la traction automobile (à l'exception des carburants utilisés par les engins agricoles sur route), pour la production d'énergie ou le chauffage (dans les secteurs agricoles ou résidentiels). Elle comprend aussi les carburants utilisés pour la pêche en haute mer, le long du littoral et dans les eaux intérieures. Divisions 01, 02 et 05 de la CITI ;
- *Services marchands et publics* : Cette rubrique recouvre toutes les activités qui relèvent des Divisions 41, 50, 51, 52, 55, 63, 64, 65, 66, 67, 70, 71, 72, 73, 74, 75, 80, 85, 90, 91, 92, 93 et 99 ;
- *Résidentiel* : Cette rubrique couvre toutes les quantités consommées par les ménages, à l'exception des combustibles utilisés dans les transports. Elle comprend les ménages employant du personnel domestique (Division 95 de la CITI), ce qui représente une faible part de la consommation résidentielle totale ;
- *Non spécifiés* : Cette rubrique couvre toutes les quantités de combustibles consommées qui n'ont pas été précisées ailleurs (par exemple, la consommation de combustibles pour les activités militaires, à l'exclusion des carburants des soutages maritimes internationaux, du secteur du transport routier et du transport aérien intérieur, et la consommation dans les catégories précitées pour lesquelles des données ventilées n'ont pas été fournies).

4. Utilisations non énergétiques

Les utilisations non énergétiques comprennent la consommation des *autres* produits pétroliers, notamment white spirit, paraffines, lubrifiants, bitume et produits divers (voir les sections 3.C.10 et 3.C.11). Ils incluent également les utilisations non énergétiques du charbon (excepté pour la tourbe). Ces produits se trouvent ventilés à part, dans la consommation finale, sous la rubrique *utilisations non énergétiques*. Il est présumé que l'usage de ces produits est strictement non énergétique. Il convient de noter que le coke de pétrole ne figure sous la rubrique *utilisations non énergétiques* que si cette utilisation est prouvée ; dans le cas contraire ce produit est comptabilisé avec les utilisations énergétiques dans l'industrie ou dans les autres secteurs.

Les chiffres concernant les produits d'alimentation de l'industrie pétrochimique sont comptabilisés dans le secteur de l'industrie, au titre de l'industrie chimique et figurent séparément à la rubrique : *dont : produits d'alimentation*. Sont compris dans cette rubrique tous les produits pétroliers, y compris le naphta, à l'exception des *autres produits pétroliers* énumérés à la section 3.C.11.

3. NOTES CONCERNANT LES SOURCES D'ENERGIE

A. Charbon

La rubrique *mines de charbon* ne comprend que le charbon utilisé directement par les charbonnages. Elle exclut le charbon consommé par les centrales électriques minières (compris dans la rubrique *transformation* - centrales électriques) et les quantités de charbon allouées gratuitement aux mineurs et à leurs familles (considérées comme consommation des ménages et classées de ce fait dans la rubrique *autres secteurs* - résidentiel).

1. Charbon à coke

On appelle charbon à coke un charbon d'une qualité permettant la production d'un coke susceptible d'être utilisé dans les hauts-fourneaux. Son pouvoir calorifique supérieur dépasse 23 865 kJ/kg (5 700 kcal/kg), valeur mesurée pour un combustible exempt de cendres, mais humide.

2. Autres charbons bitumineux et anthracite

Les autres charbons bitumineux sont utilisés pour la production de vapeur et pour le chauffage des locaux. Cette catégorie comprend tous les charbons anthraciteux et bitumineux autres que les charbons à coke. Son pouvoir calorifique supérieur dépasse 23 865 kJ/kg (5 700 kcal/kg), mais est généralement inférieur à celui du charbon à coke.

3. Charbons sous-bitumineux

On appelle charbons sous-bitumineux les charbons non agglutinants d'un pouvoir calorifique supérieur compris entre 17 435 kJ/kg (4 165 kcal/kg) et 23 865 kJ/kg (5 700 kcal/kg), contenant plus de 31 pour cent de matières volatiles sur produit sec exempt de matières minérales.

4. Lignite et charbon sous-bitumineux

Le lignite/charbon sous-bitumineux est un charbon non agglutinant dont le pouvoir calorifique supérieur n'atteint pas 17 435 kJ/kg (4 165 kcal/kg), et qui contient plus de 31 pour cent de matières volatiles sur produit sec exempt de matières minérales. Les schistes bitumineux sont également inclus dans cette catégorie.

5. Tourbe

Sédiment fossile d'origine végétale poreux ou comprimé, combustible à haute teneur en eau (jusqu'à 90 pour cent sur brut), facilement rayé, de couleur brun clair à brun foncé. La tourbe utilisée à des fins non énergétiques n'est pas prise en compte.

6. Coke de four à coke (coke de cokerie) et coke d'usine à gaz

Le coke de cokerie est un produit solide obtenu par carbonisation à haute température du charbon, et surtout du charbon à coke ; la teneur en eau et en matières volatiles est faible. Le semi-coke, produit solide obtenu par carbonisation à basse température, le coke, le semi-coke de lignite/charbon sous-bitumineux, le poussier de coke et le coke de fonderie sont également inclus dans cette rubrique. La rubrique *secteur énergie-autres* représente la consommation interne des cokeries. La consommation de l'industrie sidérurgique ne

comprend pas le coke transformé en gaz de haut fourneau. Pour obtenir la consommation totale de coke de cokerie de l'industrie sidérurgique, il faut ajouter les quantités de coke transformées en gaz de haut fourneau (elles apparaissent sous la rubrique *hauts-fourneaux et usines à gaz*).

Le coke d'usine à gaz est un sous-produit de la houille utilisée pour la production de gaz de ville dans les usines à gaz. Il est principalement utilisé pour le chauffage. La rubrique *secteur énergie-autres* couvre la consommation de coke de gaz dans les usines à gaz.

7. Agglomérés et briquettes de lignite (et de tourbe) (BKB)

Les agglomérés sont des combustibles composites fabriqués à partir de fines de charbon par moulage avec adjonction d'un liant. La quantité d'agglomérés produite est donc légèrement supérieure au tonnage de houille effectivement utilisé à cet effet. La consommation d'agglomérés durant le processus de fabrication des agglomérés apparaît sous la rubrique *secteur énergie-autres*.

Les briquettes de lignite (BKB) sont des combustibles composites fabriqués à partir du lignite/charbon sous-bitumineux, et agglomérés sous haute pression. Ces données couvrent les briquettes de tourbe, le lignite séché, la poussière de lignite et les fines de lignite. La consommation des usines de briquettes est comprise sous la rubrique *secteur énergie-autres*.

B. Pétrole brut, liquides de gaz naturel et produits d'alimentation des raffineries

Sous le titre *transformation*, la rubrique *raffineries de pétrole* indique les quantités de pétrole brut, de LGN, de produits d'alimentation des raffineries, d'additifs et d'autres hydrocarbures qui sont utilisées dans le processus de raffinage.

1. Pétrole brut

C'est une huile minérale, constituée d'un mélange d'hydrocarbures d'origine naturelle. Sa couleur va du jaune au noir, sa densité et sa viscosité sont variables. Cette catégorie comprend aussi les condensats (provenant des séparateurs) directement récupérés sur les périmètres d'exploitation des hydrocarbures gazeux dans les installations de séparation des phases liquide et gazeuse.

Les autres hydrocarbures, notamment le pétrole brut synthétique, les huiles minérales extraites des roches bitumineuses telles que schistes, sables asphaltiques, etc. ainsi que les huiles issues de la liquéfaction du charbon figurent à la ligne *autres sources*. Voir la section 2.A.2.

Les huiles émulsionnées (par exemple, l'orimulsion) sont prises en compte dans cette catégorie.

2. Liquides de gaz naturel (LGN)

Les LGN sont des hydrocarbures liquides ou liquéfiés obtenus pendant le traitement, la purification et la stabilisation du gaz naturel. Il s'agit des fractions de gaz naturel qui sont récupérées sous forme liquide dans les installations de séparation, dans les installations sur les gisements ou dans les usines de traitement du gaz. Les LGN comprennent l'éthane, le propane, le butane, le pentane, l'essence naturelle et les condensats, sans que la liste soit limitative. Ils peuvent aussi inclure certaines quantités de substances autres que des hydrocarbures.

3. Produits d'alimentation des raffineries

C'est un produit ou une combinaison de produits dérivés du pétrole brut et destinés à subir un traitement ultérieur autre qu'un mélange dans l'industrie du raffinage. Il est transformé en un ou plusieurs constituants et/ou produits finis. Cette définition recouvre les produits finis qui sont importés pour la consommation des raffineries et ceux qui sont renvoyés par l'industrie pétrochimique aux raffineries.

4. Additifs

Les additifs sont des substances autres que des hydrocarbures qui sont ajoutées ou mélangées à un produit afin de modifier ses propriétés, pour améliorer par exemple ses caractéristiques lors de la combustion. Les alcools et les éthers (MTBE ou méthyl tertio-butyl éther), ou des substances telles que le plomb tétraéthyle, sont comptabilisés dans

cette rubrique. L'éthanol n'y figure pas, mais apparaît à la rubrique *gaz/liquides tirés de la biomasse*.

C. Produits pétroliers

Ce sont tous les produits dérivés du pétrole qui peuvent être obtenus par distillation et qui sont, en général, utilisés en dehors de l'industrie du raffinage. Les produits finis classés comme produits d'alimentation des raffineries (voir ci-dessus) n'entrent pas dans cette catégorie.

Les données sur la *production* de produits pétroliers font apparaître, pour chaque produit, la production brute des raffineries.

La consommation de combustibles des raffineries (figurant dans le *secteur énergie*, ligne *raffineries de pétrole*) représente leur consommation de produits pétroliers, qu'il s'agisse de produits intermédiaires ou de produits finis, utilisés par exemple pour le chauffage, l'éclairage, la traction, etc.

1. Gaz de raffinerie (non liquéfiés)

Cette catégorie couvre, par définition, les gaz non condensables obtenus dans les raffineries lors de la distillation du pétrole brut ou du traitement des produits pétroliers (par craquage, par exemple). Il s'agit principalement d'hydrogène, de méthane, d'éthane et d'oléfines. Sont compris également les gaz retournés aux raffineries par l'industrie pétrochimique. La production de gaz de raffinerie correspond à la production brute. La consommation propre des raffineries est comptabilisée séparément à la ligne *raffineries de pétrole* dans la rubrique *secteur énergie*.

2. Gaz de pétrole liquéfiés (GPL) et éthane

Il s'agit des fractions légères d'hydrocarbures paraffiniques qui s'obtiennent lors du raffinage ainsi que dans les installations de stabilisation du pétrole brut et de traitement du gaz naturel. Ce sont le propane (C_3H_8) et le butane (C_4H_{10}) ou un mélange de ces deux hydrocarbures. Ils sont généralement liquéfiés sous pression pour le transport et le stockage.

L'éthane (C_2H_6) est un hydrocarbure à chaîne droite, gazeux à l'état naturel. C'est un gaz paraffinique incolore que l'on extrait du gaz naturel et des gaz de raffinerie.

3. Essence moteur

C'est un hydrocarbure léger utilisé dans les moteurs à combustion interne, tels que ceux des véhicules à moteur, à l'exception des aéronefs. L'essence moteur est distillée entre 35°C et 215°C et utilisée comme carburant pour les moteurs terrestres à allumage commandé. L'essence moteur peut contenir des additifs, des composés oxygénés et des additifs améliorant l'indice d'octane, notamment des composés plombés comme le PTE (plomb tétraéthyle) et le PTM (plomb tétraméthyle).

4. Essence aviation

Il s'agit d'une essence spécialement préparée pour les moteurs à pistons des avions, avec un indice d'octane adapté au moteur, un point de congélation de -60°C et un intervalle de distillation habituellement compris entre 30°C et 180°C.

5. Carburéacteurs

Cette catégorie comprend les carburéacteurs type essence et les carburéacteurs type kérosène, qui répondent aux spécifications d'utilisation pour les turbomoteurs pour avion.

a) Carburéacteur type essence

Cette catégorie comprend tous les hydrocarbures légers utilisés dans les turbomoteurs pour avion. Ils distillent entre 100°C et 250°C. Ils sont obtenus par mélange de kérosène et d'essence ou de naphtas, de manière à ce que la teneur en aromatiques soit égale ou inférieure à 25 pour cent en volume, et que la pression de vapeur se situe entre 13,7 kPa et 20,6 kPa. Des additifs peuvent être ajoutés afin d'accroître la stabilité et la combustibilité du carburant.

b) Carburéacteur type kérosène

C'est un distillat moyen utilisé dans les turbomoteurs pour avion, qui répond aux même caractéristiques de distillation et présente le même point d'éclair que le kérosène (entre 150°C et 300°C, mais ne dépassant

pas 250°C en général). De plus, il est conforme à des spécifications particulières (concernant notamment le point de congélation), définies par l'Association du transport aérien international (IATA).

6. Kérosène

Le kérosène comprend les distillats de pétrole raffiné dont la volatilité est comprise entre celle de l'essence et celle du gazole/carburant diesel. C'est une huile moyenne qui distille entre 150°C et 300°C.

7. Gazole/carburant diesel (Distillat de coupe intermédiaire)

Les gazoles/carburants diesel sont des huiles lourdes. Les gazoles sont extraits de la dernière fraction issue de la distillation atmosphérique du pétrole brut, tandis que les gazoles lourds sont obtenus par redistillation sous vide du résidu de la distillation atmosphérique. Le gazole/carburant diesel distille entre 180°C et 380°C. Plusieurs qualités sont disponibles, selon l'utilisation : gazole pour moteur diesel à allumage par compression (automobiles, poids lourds, bateaux, etc.), fioul léger pour le chauffage des locaux industriels et commerciaux, et autres gazoles, y compris les huiles lourdes distillant entre 380°C et 540°C utilisées comme produit d'alimentation dans l'industrie pétrochimique.

8. Fioul lourd (résiduel)

Ce sont les huiles lourdes constituant le résidu de distillation. La définition englobe tous les fiouls résiduels (y compris ceux obtenus par mélange). La viscosité cinétique est supérieure à 10 cSt à 80°C. Le point d'éclair est toujours supérieur à 50°C, et la densité est toujours supérieure à 0,9 kg/l.

9. Naphtas

Les naphtas sont un produit d'alimentation des raffineries destiné soit à l'industrie pétrochimique (par exemple, fabrication d'éthylène ou production de composés aromatiques) soit à la production d'essence par reformage ou isomérisation dans la raffinerie. Les naphtas correspondent aux fractions distillant entre 30°C et 210°C ou sur une partie de cette plage de température. Les naphtas importés pour mélange doivent être indiqués dans les importations, puis repris à la ligne *transferts*, affectés d'un signe négatif pour les naphtas, et d'un signe positif pour les produits finis correspondants (par exemple, essence).

10. Coke de pétrole

Le coke de pétrole est un résidu solide noir brillant, obtenu principalement par craquage et carbonisation de produits d'alimentation dérivés du pétrole, de produits de la distillation sous vide du pétrole brut, de goudrons et de poix, dans des procédés tels que la cokéfaction différée ou la cokéfaction fluide. Il se compose essentiellement de carbone (90 à 95 pour cent) et brûle en laissant peu de cendres. Il est employé comme produit d'alimentation dans les cokeries des usines sidérurgiques, pour la chauffe, pour la fabrication d'électrodes et pour la production de substances chimiques. Les deux qualités les plus importantes de coke sont le coke de pétrole et le coke de pétrole calciné. Cette catégorie comprend également le coke de catalyse, qui se dépose sur le catalyseur pendant les opérations de raffinage ; ce coke n'est pas récupérable, et il est en général brûlé comme combustible dans les raffineries.

11. Autres produits pétroliers

La catégorie *autres produits pétroliers* regroupe les white spirit et SBP, les lubrifiants, le bitume, les paraffines et d'autres produits.

a) White spirit et essences spéciales (SBP)

Ce sont des distillats intermédiaires raffinés, dont l'intervalle de distillation se situe entre celui des naphtas et celui du kérosène.

Ils se subdivisent en :

*i) **Essences spéciales (SBP) :*** Huiles légères distillant entre 30°C et 200°C et dont l'écart de température entre les points de distillation de 5 pour cent et 90 pour cent en volume, y compris les pertes, est inférieur ou égal à 60°C. En d'autres termes, il s'agit d'une huile légère, de coupe plus étroite que celle des essences moteur. On distingue 7 ou 8 qualités d'essences spéciales, selon la position de la coupe dans l'intervalle de distillation défini plus haut.

*ii) **White spirit :*** Essence industrielle dont le point d'éclair est supérieur à 30°C. L'intervalle de distillation du white spirit est compris entre 135°C et 200°C.

b) Lubrifiants

Les lubrifiants sont des hydrocarbures obtenus à partir de distillats ou de résidus ; ils sont principalement utilisés pour réduire les frottements entre surfaces d'appui. Cette catégorie comprend tous les grades d'huiles lubrifiantes, depuis les spindles jusqu'aux huiles à cylindres, et les huiles entrant dans les graisses, y compris les huiles moteur et tous les grades d'huiles de base pour lubrifiants.

c) Bitume

Hydrocarbure solide, semi-solide ou visqueux, à structure colloïdale, de couleur brune à noire ; c'est un résidu de la distillation du pétrole brut obtenu par distillation sous vide des huiles résiduelles de distillation atmosphérique. Le bitume est aussi souvent appelé asphalte, et il est principalement employé pour le revêtement des routes et pour les matériaux de toiture. Cette catégorie couvre le bitume fluidisé et le cutback.

d) Paraffines

Hydrocarbures aliphatiques saturés (dont la formule générale est C_nH_{2n+2}). Les paraffines sont des résidus du déparaffinage des huiles lubrifiantes ; elles présentent une structure cristalline avec $C > 12$ et, pour principales caractéristiques, d'être incolores, inodores et translucides ainsi que d'avoir un point de fusion supérieur à 45°C.

e) Autres

Tous les produits pétroliers qui ne sont pas classés ci-dessus, par exemple, le goudron, le soufre et la graisse. Cette catégorie comprend également les composés aromatiques (par exemple, BTX ou benzène, toluène et xylènes) et les oléfines (par exemple, propylène) produits dans les raffineries.

D. Gaz

Les valeurs relatives aux quatre catégories de gaz sont toutes exprimées en térajoules, sur la base du **pouvoir calorifique supérieur**.

1. Gaz naturel

Le gaz naturel est constitué de gaz, méthane essentiellement, sous forme liquide ou gazeuse, extraits de gisements naturels souterrains. Il peut s'agir aussi bien de gaz "non associé" provenant de gisements qui produisent uniquement des hydrocarbures sous forme gazeuse, que de gaz "associé" obtenu en même temps que le pétrole brut, ou de méthane récupéré dans les mines de charbon (grisou).

La production est mesurée après élimination des impuretés et extraction des LGN et du soufre. Elle exclut les quantités de gaz réinjectées et les quantités rejetées ou brûlées à la torchère. Elle comprend les quantités de gaz utilisées dans l'industrie gazière et le gaz transporté par gazoduc.

2. Gaz d'usine à gaz

Cette catégorie couvre tous les types de gaz produits dans les usines des entreprises publiques ou privées ayant pour principal objet la production, le transport et la distribution de gaz. Cette catégorie comprend le gaz produit par carbonisation (y compris le gaz produit dans les fours à coke et transféré aux usines à gaz), par gazéification totale avec ou sans enrichissement au moyen de produits pétroliers, par craquage du gaz naturel ou par reformage et simple mélange avec d'autres gaz et/ou de l'air. Cette rubrique recouvre également le gaz naturel de substitution dont le pouvoir calorifique est élevé, et qui est produit par conversion chimique d'hydrocarbures.

3. Gaz de cokerie

Le gaz de cokerie est un sous-produit de la fabrication du coke de cokerie utilisé en sidérurgie.

4. Gaz de haut fourneau

Le gaz de haut fourneau est obtenu lors de la combustion du coke dans les hauts-fourneaux de l'industrie sidérurgique. Il est récupéré et utilisé comme combustible, en partie dans l'usine même, et en partie pour d'autres procédés de l'industrie sidérurgique, ou encore dans des centrales électriques dotées d'équipements adaptés pour en brûler. Cette rubrique comprend également le gaz obtenu comme sous-produit lors de l'élaboration de l'acier dans les fours à oxygène ou convertisseurs basiques avec soufflage d'oxygène, qui est récupéré à la sortie du gueulard. Ce gaz est également appelé gaz de convertisseur ou gaz LD ou gaz BOS.

E. Energies renouvelables combustibles et déchets

Les données concernant ces quatre catégories de combustibles sont toutes exprimées en térajoules, sur la base du **pouvoir calorifique inférieur**.

1. Biomasse solide et produits d'origine animale

La biomasse est, par définition, toute matière végétale utilisée directement comme combustible ou transformée avant de la brûler sous une autre forme. Elle comprend le bois, les déchets végétaux (y compris les déchets de bois et les cultures destinées à la production d'énergie), les matières/déchets d'origine animale, les lessives sulfitiques (résidus de fabrication de la pâte à papier), également appelées "liqueur noire" (liqueur alcaline de rejet des digesteurs lors de la production de pâte au sulfate ou à la soude dans le procédé d'élaboration du papier, dont le contenu énergétique provient de la lignine extraite de la pâte chimique) et autre biomasse solide.

Le charbon de bois produit à partir de la biomasse solide est également inclus ici. Etant donné que le charbon de bois est un produit secondaire, son traitement est légèrement différent de celui de la biomasse primaire. La production de charbon de bois (un produit du processus de transformation) est compensée par les consommations correspondantes de biomasse primaire dans le processus de production. Les pertes lors de ce processus sont reportées dans la ligne *Secteur transformation – autres*. Les autres approvisionnements (par exemple le commerce et les variations de stocks) ainsi que la consommation de charbon de bois sont agrégés directement avec la biomasse primaire. Cependant, dans quelques pays, seule la biomasse primaire est reportée. La production de charbon de bois reportée est disponible séparement dans les Tableaux sommaires à la fin de la publication.

2. Gaz/liquides tirés de la biomasse

Le biogaz est produit principalement par fermentation anaérobie de biomasse et de déchets solides et brûlés pour produire de la chaleur et/ou de l'énergie électrique. Cette catégorie comprend les gaz de décharge, les gaz de digestion des boues (gaz issus des eaux usées et des lisiers) et d'autres biogaz. Les liquides tirés de la biomasse qui comprennent les bio-additifs comme l'éthanol entrent également dans cette catégorie.

3. Déchets urbains et assimilés

Les déchets urbains correspondent aux produits brûlés directement pour produire de la chaleur et/ou de l'énergie électrique, dont notamment les déchets des secteurs résidentiel et commercial ainsi que du secteur des services publics, qui sont recueillis par les autorités municipales pour leur élimination dans des installations centralisées. Les déchets hospitaliers entrent dans cette catégorie.

4. Déchets industriels

Il s'agit de produits liquides et solides brûlés directement, généralement dans des installations spécialisées, pour produire de la chaleur et/ou de l'énergie électrique et qui ne sont pas notifiés dans la catégorie *biomasse solide*.

F. Electricité et chaleur

1. Electricité

La production brute d'électricité est mesurée aux bornes de tous les groupes d'alternateurs d'une centrale. Elle comprend donc l'énergie absorbée par les équipements auxiliaires et les pertes dans les transformateurs qui sont considérés comme faisant partie intégrante de la centrale.

La différence entre production nette et brute est généralement évaluée à 7 pour cent dans les centrales thermiques classiques, à 1 pour cent dans les centrales hydroélectriques et à 6 pour cent dans les centrales nucléaires, géothermiques ou solaires. La production hydraulique comprend la production des centrales à accumulation par pompage (également appelées centrales de pompage).

2. Chaleur

La production de chaleur destinée à la vente acquiert une importance grandissante depuis quelques années. Pour tenir compte de cette évolution, la production de chaleur représente toute la production

publique de chaleur provenant des centrales de cogénération chaleur/électricité et calogènes ainsi que la chaleur vendue à des tiers par les centrales de cogénération chaleur/électricité et calogènes des autoproducteurs. Les quantités correspondantes de combustibles utilisées pour produire la chaleur destinée à la vente sont indiquées, dans le secteur transformation, aux lignes *installations de cogénération* et *centrales calogènes*. Les quantités de combustibles utilisées pour produire la chaleur qui n'est pas vendue sont rapportées dans les secteurs où cette consommation a lieu.

3. Hydroélectricité

Énergie potentielle et cinétique des eaux transformée en électricité dans les centrales hydroélectriques.

4. Énergie géothermique

Énergie thermique provenant de l'intérieur de l'écorce terrestre, généralement sous forme d'eau chaude ou de vapeur. Elle est exploitée dans les sites qui s'y prêtent :

- pour la production d'électricité en mettant à profit la vapeur sèche ou la saumure naturelle de haute enthalpie après vaporisation instantanée ;
- directement sous forme de chaleur pour le chauffage urbain, l'agriculture, etc.

5. Énergie solaire

Rayonnement solaire exploité pour la production d'eau chaude et d'électricité, au moyen de :

- capteurs plans, qui fonctionnent essentiellement en thermosiphon, pour la production d'eau chaude sanitaire ou pour le chauffage saisonnier des piscines ;
- cellules photovoltaïques ;
- centrales thermo-hélio-électriques ;

L'énergie solaire passive pour le chauffage, la climatisation et l'éclairage directs des logements ou autres bâtiments n'est pas prise en compte.

6. Energies marémotrice/houlomotrice

Énergie mécanique résultant du mouvement des marées, de la houle ou des vagues exploitée pour la production d'électricité.

7. Énergie éolienne

Énergie cinétique du vent exploitée pour la production d'électricité au moyen d'aérogénérateurs.

4. NOTES CONCERNANT LES TABLEAUX RECAPITULATIFS

Production de charbon de bois

Le charbon de bois est un produit secondaire de la biomasse, qui se compose principalement de carbone, issue de la combustion lente et incomplète du bois ou d'autres produits végétaux en l'absence d'air. On notera que dans les tableaux annuels, le charbon de bois est inclus dans la biomasse solide (voir les Notes concernant les sources d'énergie, partie 3).

Demande de produits raffinés par groupes principaux, en milliers de tonnes et millions de barils-jour

La demande de produits raffinés par groupes principaux est définie comme la somme de l'approvisionnement intérieur, des transferts et des écarts statistiques moins les entrées dans les raffineries, les industries pétrochimique et de liquéfaction du secteur transformation, et la consommation propre du secteur énergie. *L'essence moteur* comprend les additifs et les liquides tirés de la biomasse. Les *autres* comprennent le pétrole brut, les autres hydrocarbures, le gaz de raffinerie, le coke de pétrole, le white spirit et les essences spéciales, les lubrifiants, le bitume, les paraffines et les autres produits tels que le goudron, le soufre, la graisse ainsi que les composés aromatiques (par exemple, BTX ou benzène, toluène et xylène) et les oléfines (par exemple, propylène) produits dans les raffineries.

Combustibles de raffinerie indique la consommation propre de combustibles pétroliers par les raffineries pour les opérations d'équipement, de chauffage et d'éclairage, qui comprennent principalement des gaz de raffinerie, du gazole-carburant diesel et du fioul lourd.

Les *soutages* maritimes internationaux de combustibles liquides comprennent principalement du gazole-carburant diesel et du fioul lourd.

Les coefficients de conversion suivants sont valables en général pour tous les pays et pour toutes les années.

Coefficients de Conversion

	Barils/tonne
Gaz de raffinerie	8.01
Ethane	16.85
GPL	11.60
Naphta	8.50 (8.90 OCDE Europe)
Essence aviation	8.90
Essence moteur	8.53 (8.45 OCDE Europe)
Carburéacteur type essence	7.93 (8.25 OCDE)
Carburéacteur type kérosène	7.93 (7.88 OCDE Europe)
Autre kérosène	7.74 (7.88 OCDE Europe)
Gazole/carburant diesel	7.46
Fioul lourd	6.66 (6.45 OCDE Europe)
White Spirit	7.00 (8.46 OCDE)
Lubrifiants	7.09
Bitume	6.08
Paraffines	7.00 (7.85 OCDE)
Coke de pétrole	5.50
Autres produits non spécifiés	7.00 (8.00 OCDE)

Consommation d'électricité

Comprend l'utilisation de l'électricité dans les secteurs de transformation, d'énergie et de consommation finale, mais ne comprend pas les pertes de distribution.

5. COUVERTURE GEOGRAPHIQUE

L'Afrique comprend l'Afrique du Sud, l'Algérie, l'Angola, le Bénin, le Cameroun, le Congo, la République démocratique du Congo, la Côte d'Ivoire, l'Egypte, l'Erythrée, l'Ethiopie, le Gabon, le Ghana, le Kenya, la Libye, le Maroc, le Mozambique, la Namibie, le Nigéria, le Sénégal, le Soudan, la République unie de Tanzanie, le Togo, la Tunisie, la Zambie, le Zimbabwe et les **autres pays d'Afrique.**

Les autres pays d'Afrique comprennent le Botswana, le Burkina Faso, le Burundi, le Cap-Vert, la République centrafricaine, Djibouti, la Gambie, la Guinée, la Guinée-Bissau, la Guinée équatoriale, le Lesotho, le Libéria, Madagascar, le Malawi, le Mali, la Mauritanie, Maurice, le Niger, l'Ouganda, le Rwanda, Sao Tomé et Principe, les Seychelles, la Sierra Leone, la Somalie, le Swaziland et le Tchad.

Le Moyen-Orient comprend l'Arabie saoudite, Bahreïn, les Emirats arabes unis, la République islamique d'Iran, l'Iraq, Israël, la Jordanie, le Koweït, le Liban, Oman, le Qatar, la Syrie et le Yémen.

La région Europe hors OCDE comprend l'Albanie, la Bosnie-Herzégovine, la Bulgarie, Chypre, la Croatie, Gibraltar, l'ex-République yougoslave de Macédoine (FYROM), Malte, la Roumanie, la Slovénie et la République fédérative de Yougoslavie.

L'ex-URSS comprend l'Arménie, l'Azerbaïdjan, la Biélorussie, l'Estonie, la Géorgie, le Kazakhstan, le Kirghizistan, la Lettonie, la Lituanie, la République de Moldovie, l'Ouzbékistan, la Fédération de Russie, le Tadjikistan, le Turkménistan et l'Ukraine.

L'Amérique latine comprend les Antilles néerlandaises, l'Argentine, la Bolivie, le Brésil, le Chili, la Colombie, le Costa Rica, Cuba, la République dominicaine, El Salvador, l'Equateur, le Guatemala, Haïti, le Honduras, la Jamaïque, le Nicaragua, Panama, le Paraguay, le Pérou, Trinité-et-Tobago, l'Uruguay, le Venezuela et les **autres pays d'Amérique latine.**

Les autres pays d'Amérique latine comprennent Antigua-et-Barbuda, les Bahamas, la Barbade, le Belize, les Bermudes, la Dominique, la Grenade, la Guadeloupe, le Guyana, la Guyane française, la Martinique, Saint-Kitts et Nevis, Anguilla, Sainte-Lucie, Saint-Vincent et les Grenadines et le Suriname.

La Chine comprend la République populaire de Chine et Hong Kong (Chine).

L'Asie comprend le Bangladesh, Brunei, la République populaire démocratique de Corée, l'Inde, l'Indonésie, la Malaisie, Myanmar, le Népal, le Pakistan, les Philippines, Singapour, Sri Lanka, le Taipei chinois, la Thaïlande, le Viet Nam et les **autres pays d'Asie**.

Les autres pays d'Asie comprennent l'Afghanistan, le Bhoutan, les Fidji, Kiribati, les Maldives, la Nouvelle-Calédonie, la Papouasie-Nouvelle-Guinée, la Polynésie française, le Samoa, les Iles Salomon et Vanuatu.

L'**Organisation de coopération et de développement économiques (OCDE)** comprend l'Allemagne, l'Australie, l'Autriche, la Belgique, le Canada, la Corée, le Danemark, l'Espagne, les Etats-Unis, la Finlande, la France, la Grèce, la Hongrie, l'Irlande, l'Islande, l'Italie, le Japon, le Luxembourg, le Mexique, la Norvège, la Nouvelle-Zélande, les Pays-Bas, la Pologne, le Portugal, le Royaume-Uni, la République slovaque, la Suède, la Suisse, la République tchèque et la Turquie.

Dans la zone de l'OCDE :

- L'**Australie** ne comprend pas les territoires d'outre-mer;
- L'**Allemagne** tient compte des nouveaux Länder à partir de 1970;
- Le Groenland et les Iles Féroé danoises ne sont pas pris en compte dans les données relatives au **Danemark**. Cependant, avant 1990 les données sur le pétrole du Groenland sont prises en compte dans les statistiques danoises;
- L'**Espagne** englobe les Iles Canaries;
- Les **Etats-Unis** englobent Porto-Rico, Guam et les Iles Vierges ainsi que la zone franche d'Hawaï;
- Dans les données relatives à la **France**, Monaco est pris en compte, mais non les départements d'outre-mer (à savoir la Guadeloupe, la Guyane, la Martinique, la Nouvelle-Calédonie, la Polynésie française, la Réunion et Saint Pierre et Miquelon);
- L'**Italie** englobe Saint-Marin et le Vatican;
- Le **Japon** englobe Okinawa;
- Ni le Suriname ni les Antilles néerlandaises ne sont pris en compte dans les données relatives aux **Pays-Bas**;
- Le **Portugal** englobe les Açores et l'Ile de Madère;
- La **Suisse** englobe le Liechtenstein.

L'Organisation des pays exportateurs de pétrole (OPEP) comprend l'Algérie, l'Indonésie, l'Iran, l'Irak, le Koweit, la Libye, le Nigéria, Qatar, l'Arabie saoudite, les Emirats arabes unis et le Venezuela.

On notera que les pays suivants n'ont pas été pris en compte par suite d'un manque de données :

- **Afrique** : Comores, Sainte-Hélène et Sahara Occidental;
- **Amérique** : Aruba, Iles Vierges Britanniques, Iles Caïmanes, Iles Falkland, Montserrat, Saint-Pierre et Miquelon et les Iles Turks et Caïcos;
- **Asie et Océanie** : Samoa américaines, Cambodge, Ile Christmas, Iles Cook, Laos, Macao, Mongolie, Nauru, Nioué, Palaos, Tonga et Ile de Wake.

Production of Solar, Wind, Tide and Wave Electricity (GWh)

Production d'électricité d'origine solaire, éolienne, marémotrice et houlomotrice (GWh)

Elektrizitätserzeugung aus Sonnenenergie, Wind, Gezeiten und Wellen (GWh)

Produzione di energia elettrica solare, eolica e energia da moto ondoso (GWh)

太陽光、風力、潮力、波力発電量 (GWh)

Producción de electricidad solar, eólica, maremotriz y de oleaje (GWh)

Производство электроэнергии солнца, ветра, приливов и волн (ГВт.ч)

Un chiffre négatif correspond à des exportations nettes.

La ligne Monde montre la divergence entre le total des exportations et des importations mondiales.

Les divergences dans les échanges de charbon s'expliquent principalement par des différences de classification.

Net Imports of Coking Coal (1000 tonnes)

Importations nettes de charbon à coke (1000 tonnes)

Nettoimporte von Kokskohle (1000 Tonnen)

Importazioni nette di carbone siderurgico (1000 tonnellate)

原料炭の純輸入量（千トン）

Importaciones netas de carbón coquizable (1000 toneladas)

Чистый импорт коксующихся углей (тыс. т)

A negative number shows net exports.

The row World shows the discrepancy between total world exports and imports.

Discrepancies in coal trade are mainly due to inconsistent classifications.

Net Imports of Other Bituminous Coal (1000 tonnes)
Importations nettes d'autres charbons bitumineux (1000 tonnes)

Nettoimporte von sonstiger bituminöser Kohle (1000 Tonnen)

Importazioni nette di altri carboni bituminosi (1000 tonnellate)

その他歴青炭の純輸入量（千トン）

Importaciones netas de otro carbón bituminoso (1000 toneladas)

Un chiffre négatif correspond à des exportations nettes.

La ligne Monde montre la divergence entre le total des exportations et des importations mondiales.

Les divergences dans les échanges de charbon s'expliquent principalement par des différences de classification.

A negative number shows net exports.

The row World shows the discrepancy between total world exports and imports.

Discrepancies in coal trade are mainly due to inconsistent classifications.

Net Imports of Sub-Bituminous Coal (1000 tonnes)
Importations nettes de charbons sous-bitumineux (1000 tonnes)

Nettoimporte von subbituminöser Kohle (1000 Tonnen)

Importazioni nette di carbone sub-bituminoso (1000 tonnellate)

亜歴青炭の純輸入量（千トン）

Importaciones netas de otro carbón sub-bituminoso (1000 toneladas)

Чистый импорт полубитуминозных углей (тыс. т)

Un chiffre négatif correspond à des exportations nettes.

La ligne Monde montre la divergence entre le total des exportations et des importations mondiales.

Net Imports of Electricity (GWh)

Importations nettes d'électricité (GWh)

Nettoimporte von Elektrizität (GWh)

Importazioni nette di energia elettrica (GWh)

電力の純輸入量 (GWh)

Importaciones netas de electricidad (GWh)

Чистый импорт электроэнергии (ГВт.ч)

A negative number shows net exports.

The row World shows the discrepancy between total world exports and imports.

Final Consumption of Coking Coal (1000 tonnes)
Consommation finale de charbon à coke (1000 tonnes)

Endverbrauch von Kokskohle (1000 Tonnen)

Consumo finale di carbone siderurgico (1000 tonnellate)

原料炭の最終消費量（千トン）

Consumo final de carbón coquizable (1000 toneladas)

Конечное потребление коксующихся углей (тыс. т)

People's Rep. of China: up to 1978 the breakdown of final consumption by sector is incomplete.

Industry Consumption of Oil (1000 tonnes)
Consommation industrielle de pétrole (1000 tonnes)

Industrieverbrauch von Öl (1000 Tonnen)

Consumo di petrolio nell'industria (1000 tonnellate)

石油の産業用消費量（千トン）

Consumo industrial de petróleo (1000 toneladas)

Потребление нефти и нефтепродуктов промышленным сектором (тыс. т)

INTERNATIONAL ENERGY AGENCY
ENERGY STATISTICS DIVISION
POSSIBLE STAFF VACANCIES

The Division is responsible for statistical support and advice to the policy and operational Divisions of the International Energy Agency. It also produces a wide range of annual and quarterly publications complemented by CD-ROMs and on-line data services. For these purposes, the Division maintains, on a central computer and an expanding network of microcomputers, extensive international databases covering most aspects of energy supply and use.

Vacancies for statisticians occur from time to time. Typically their work includes:

- Gathering and vetting data from questionnaires and publications, discussions on data issues with respondents to questionnaires in national administrations and fuel companies;
- Managing energy databases on a mainframe computer and microcomputers in order to maintain accuracy and timeliness of output;
- Preparing computer procedures for the production of tables, reports and analyses. Seasonal adjustment of data and analysis of trends and market movements;
- Preparing studies on an ad-hoc basis as required by other Divisions of the International Energy Agency.

Nationals of any OECD Member country are eligible for appointment. Basic salaries range from 2450 to 3250 Euros per month, depending on qualifications. The possibilities for advancement are good for candidates with appropriate qualifications and experience. Tentative enquiries about future vacancies are welcomed from men and women with relevant qualifications and experience. Applications in French or English, accompanied by a curriculum vitae, should be sent to:

Ms. Beth Hunter
Head of Administrative Unit
IEA, 9 rue de la Fédération
75739 Paris Cedex 15, FRANCE

AGENCE INTERNATIONALE DE L'ENERGIE
DIVISION DES STATISTIQUES DE L'ENERGIE
VACANCES D'EMPLOI EVENTUELLES

La Division est chargée de fournir une aide et des conseils dans le domaine statistique aux Divisions administratives et opérationnelles de l'Agence internationale de l'énergie. En outre, elle diffuse une large gamme de publications annuelles et trimestrielles complétées par CD-ROMs ainsi que des services de données sur internet. A cet effet, la Division tient à jour, sur un ordinateur central et un réseau de plus en plus étendu de micro-ordinateurs, de vastes bases de données internationales portant sur la plupart des aspects de l'offre et de la consommation d'énergie.

Des postes de statisticien sont susceptibles de se libérer de temps à autre. Les fonctions dévolues aux titulaires de ces postes sont notamment les suivantes :

- Rassembler et valider les données tirées de questionnaires et de publications, ainsi que d'échanges de vues sur les données avec les personnes des Administrations nationales ou des entreprises du secteur de l'énergie qui répondent aux questionnaires;
- Gérer des bases de données relatives à l'énergie sur un ordinateur central et des micro-ordinateurs en vue de s'assurer de l'exactitude et de l'actualisation des données de sortie;
- Mettre au point des procédures informatiques pour la réalisation de tableaux, rapports et analyses. Procéder à l'ajustement saisonnier des données et analyses relatives aux tendances et aux fluctuations du marché;
- Effectuer des études en fonction des besoins des autres Divisions de l'Agence internationale de l'énergie.

Ces postes sont ouverts aux ressortissants des pays Membres de l'OCDE. Les traitements de base sont compris entre 2450 et 3250 Euros par mois, suivant les qualifications. Les candidats possédant les qualifications et l'expérience appropriées se verront offrir des perspectives de promotion. Les demandes de renseignements sur les postes susceptibles de se libérer qui émanent de personnes dotées des qualifications et de l'expérience voulues seront les bienvenues. Les candidatures, rédigées en français ou en anglais et accompagnées d'un curriculum vitae, doivent être envoyées à l'adresse suivante :

Mme Beth Hunter
Head of Administrative Unit
IEA, 9 rue de la Fédération
75739 Paris Cedex 15, FRANCE
beth.hunter@ica.org

On-Line Data Services

In early 2001, the International Energy Agency launched its long-awaited on-line data service. Users can now instantly access not only all the data published in this book but also all the time-series used for preparing this publication and all the other statistics publications of the IEA. The data are available on-line, either through annual subscription or pay-per-view access. More information on this new service can be found on our website: http://data.iea.org/.

NINE ANNUAL PUBLICATIONS

Coal Information 2001

Issued annually since 1983, this publication provides comprehensive information on current world coal market trends and long-term prospects. Compiled in cooperation with the Coal Industry Advisory Board, it contains thorough analysis and current country-specific statistics for OECD Member countries and selected non-OECD countries on coal prices, demand, trade, production, productive capacity, emissions standards for coal-fired boilers, coal ports, coal-fired power stations and coal data for non-OECD countries. This publication is a key reference tool for all sectors of the coal industry as well as for OECD Member country governments. **Caution: this publication is not being updated in 2002. However, new data are available on CD ROM and in our on-line service.** *Published August 2001.*

Electricity Information 2002

This publication brings together in one volume the IEA's data on electricity and heat supply and demand in the OECD. The report presents a comprehensive picture of electricity capacity and production, consumption, trade and prices for the OECD regions and individual countries in over 20 separate tables for each OECD country. Detailed data on the fuels used for electricity and heat production are also presented.
Published September 2002.

Natural Gas Information 2002

A detailed reference work on gas supply and demand, covering not only the OECD countries but also the rest of the world. Contains essential information on LNG and pipeline trade, gas reserves, storage capacity and prices. The main part of the book, however, concentrates on OECD countries, showing a detailed gas supply and demand balance for each individual country and for the three OECD regions: North America, Europe and Asia-Pacific, as well as a breakdown of gas consumption by end-user. Import and export data are reported by source and destination. *Published September 2002.*

Oil Information 2002

A comprehensive reference book on current developments in oil supply and demand. The first part of this publication contains key data on world production, trade, prices and consumption of major oil product groups, with time series back to the early 1970s. The second part gives a more detailed and comprehensive picture of oil supply, demand, trade, production and consumption by end-user for each OECD country individually and for the OECD regions. Trade data are reported extensively by origin and destination. *Published August 2002.*

Energy Statistics of OECD Countries 1999-2000

No other publication offers such in-depth statistical coverage. It is intended for anyone involved in analytical or policy work related to energy issues. It contains data on energy supply and consumption in original units for coal, oil, natural gas, combustible renewables/wastes and products derived from these primary fuels, as well as for electricity and heat. Data are presented for the two most recent years available in detailed supply and consumption tables. Historical tables summarise data on production, trade and final consumption. Each issue includes definitions of products and flows and explanatory notes on the individual country data.
Published June 2002.

Energy Balances of OECD Countries 1999-2000

A companion volume to *Energy Statistics of OECD Countries*, this publication presents standardised energy balances expressed in million tonnes of oil equivalent. Energy supply and consumption data are divided by main fuel: coal, oil, gas, nuclear, hydro, geothermal/solar, combustible renewables/wastes, electricity and heat. This allows for easy comparison of the contributions each fuel makes to the economy and their interrelationships through the conversion of one fuel to another. All of this is essential for estimating total energy supply, forecasting, energy conservation, and analysing the potential for interfuel substitution. Complete energy balances are presented for the two most recent years available. Historical tables summarise key energy and economic indicators as well as data on production, trade and final consumption. Each issue includes definitions of products and flows and explanatory notes on the individual country data as well as conversion factors from original units to tonnes of oil equivalent. *Published June 2002.*

Energy Statistics of Non-OECD Countries 1999-2000

This publication offers the same in-depth statistical coverage as the homonymous publication covering OECD countries. It includes data in original units for over 100 individual countries and nine main regions. The consistency of OECD and non-OECD countries' detailed statistics provides an accurate picture of the global energy situation. For a description of the content, please see *Energy Statistics of OECD Countries* above. *Published September 2002.*

Energy Balances of Non-OECD Countries 1999-2000

A companion volume to the publication *Energy Statistics of Non-OECD Countries*, this publication presents energy balances in million tonnes of oil equivalent and key economic and energy indicators for over 100 individual countries and nine main regions. It offers the same statistical coverage as the homonymous publication covering OECD Countries, and thus provides an accurate picture of the global energy situation. For a description of the content, please see *Energy Balances of OECD Countries* above. *Published September 2002.*

CO_2 Emissions from Fuel Combustion - 2002 Edition

In order for nations to tackle the problem of climate change, they need accurate greenhouse gas emissions data. This publication provides a new basis for comparative analysis of CO_2 emissions from fossil fuel combustion, a major source of anthropogenic emissions. The data in this book are designed to assist in understanding the evolution of these emissions from 1971 to 2000 on a country, regional and worldwide basis. They should help in the preparation and the follow-up to the Eighth Conference of the Parties (COP-8) meeting under the U.N. Climate Convention in New Delhi in October-November 2002. Emissions were calculated using IEA energy databases and the default methods and emissions factors from the *Revised 1996 IPCC Guidelines for National Greenhouse Gas Inventories. Published October 2002.*

TWO QUARTERLIES

Oil, Gas, Coal and Electricity, Quarterly Statistics

Oil statistics cover OECD production, trade (by origin and destination), refinery intake and output, stock changes and consumption for crude oil, NGL and nine selected oil product groups. Statistics for natural gas show OECD supply, consumption and trade (by origin and destination). Coal data cover the main OECD and world-wide producers of hard and brown coal and major exporters and importers of steam and coking coal. Trade data for the main OECD countries are reported by origin and destination. Electricity statistics cover production (by major fuel category), consumption and trade for 29 OECD countries. Quarterly data on world oil and coal production are included, as well as world steam and coking coal trade.

Energy Prices and Taxes

This publication responds to the needs of the energy industry and OECD governments for up-to-date information on prices and taxes in national and international energy markets. It contains for OECD countries and certain non-OECD countries prices at all market levels: import prices, industry prices and consumer prices. The statistics cover the main petroleum products, gas, coal and electricity, giving for imported products an average price both for importing country and country of origin. Every issue includes full notes on sources and methods and a description of price mechanisms in each country.

CD-ROMs

To complement its publications, the Energy Statistics Division produces CD-ROMs containing the complete databases which are used for preparing the statistics publications. State-of-the-art software allows you to access and manipulate all these data in a very user-friendly manner and includes graphic and mapping facilities.

Annual CD-ROMs

- Energy Statistics of OECD Countries, 1960-2000
- Energy Balances of OECD Countries, 1960-2000
- Energy Statistics of Non-OECD Countries, 1971-2000
- Energy Balances of Non-OECD Countries, 1971-2000
- CO_2 Emissions from Fuel Combustion 1960/1971-2000
- Coal Information 2002
- Electricity Information 2002
- Natural Gas Information 2002
- Oil Information 2002

Quarterly CD-ROMs

- Energy Prices and Taxes

ON-LINE DATA SERVICES

All the databases available on CD-ROM are now also accessible over the Internet at http://data.iea.org/. For additional information on this new service see the note at the beginning of these pages.

Furthermore, the IEA *Monthly Oil Data Service* and a *Monthly Gas Data Service* (see boxes below) can also be accessed over the Internet.

The IEA Monthly Oil Data Service

The IEA Monthly Oil Data Service provides the detailed databases of historical and projected information which is used in preparing the IEA's monthly Oil Market Report (OMR). The IEA Monthly Oil Data Service comprises three packages:

- ***Supply, Demand, Balances and Stocks;***
- ***Trade;***
- ***Field-by-Field Supply;***

available separately or combined as a subscriber service on the Internet. The data are available two days after the official release of the Oil Market Report.

A full description of this service is available on our web site (http://www.iea.org.)

The IEA Monthly Gas Data Service

The Monthly Gas Data Service provides for OECD countries historical and current data on natural gas supply and demand, as well as detailed information on trade origins and destinations. Data can be obtained in different ways from the Internet.

A description of the service is available on our web site (http://data.iea.org).

For more information on any of the IEA statistics products, please feel free to contact Ms. Sharon Michel in the Energy Statistics Division, E-mail: sharon.michel@iea.org; Tel: (+33 1) 40 57 66 25; Fax: (+33 1) 40 57 66 49.
