The Department of Economic and Social Affairs of the United Nations Secretariat is a vital interface between global policies in the economic, social and environmental spheres and national action. The Department works in three main interlinked areas: (i) it compiles, generates and analyses a wide range of economic, social and environmental data and information on which Members States of the United Nations draw to review common problems and to take stock of policy options; (ii) it facilitates the negotiations of Member States in many intergovernmental bodies on joint courses of action to address ongoing or emerging global challenges; and (iii) it advises interested Governments on the ways and means of translating policy frameworks developed in United Nations conferences and summits into programmes at the country level and helps build national capacities through technical assistance.

NOTE

Symbols of United Nations documents are composed of capital letters combined with figures. Mention of such a symbol indicates a reference to a United Nations document. The first 14 editions of the National Accounts Yearbook were issued without series symbols.

The designations used in this publication have been provided by the competent authorities. Those designations and the presentation of material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

Where the designation "country or area" appears in the headings of tables, it covers countries, territories, cities or areas.

INTRODUCTION

1. This is the fiftieth issue of *National Accounts Statistics: Main Aggregates and Detailed Tables*[1,2] showing detailed national accounts estimates for 193 countries and areas for the reporting years 1997 to 2008. Like the previous issues, it has been prepared by the Statistics Division of the Department for Economic and Social Affairs of the United Nations Secretariat with the generous co-operation of national statistical offices. It is issued in accordance with the recommendation of the Statistical Commission at its first session[3] that the Statistics Division of the United Nations should publish regularly the most recent available data on national accounts for as many countries and areas as possible.

THE NATIONAL ACCOUNTS QUESTIONNAIRE

2. This publication is the tenth issue based on the United Nations National Accounts Questionnaire (NAQ) introduced in October 1999, which in turn is based on *the System of National Accounts 1993 (1993 SNA)*[4].

3. The 1993 SNA was unanimously recommended to the United Nations Economic and Social Council by its Statistical Commission at its 24th session in March 1993. Similar to the recommendation made in 1968 for its predecessor, *A System of National Accounts* (1968 SNA)[5], the Council in its resolution 1993/5 of 12 July 1993 recommends that Member States use the 1993 SNA in the international reporting of comparable national accounting data. However, it should be highlighted that the Council went a few steps further in 1993 and also recommends that Member States consider using the 1993 SNA: (a) as the standard for the compilation of their national accounts statistics, (b) to promote the integration of economic and related statistics, and (c) as an analytical tool. In 2003 the United Nations Statistical Commission (UNSC) called for an update of the 1993 SNA. The first 17 Chapters of the 2008 SNA, comprising the accounting rules, the accounts and tables, and their integration was approved by the UNSC in 2008; Chapters 18 to 29, comprising the interpretations and extensions of the accounts and tables of the System, was approved by the UNSC in 2009. The updated SNA, called The System of National Accounts 2008[6], or in short the 2008 SNA, was finalised in September 2009. It is expected that countries would start compiling national accounts data according to the 2008 SNA by 2010.

4. Taking into account all the above recommendations the United Nations Statistics Division (UNSD), in cooperation with the United Nations Regional Commissions, has designed the United Nations National Accounts Questionnaire (NAQ) based with the following objectives in mind:

(a) The tables included are those that provide a data set most relevant for global and regional analysis carried out by the United Nations Department of Economic and Social Affairs (DESA) and other international and regional organizations. It should be noted that the scope of the 1993 SNA aims at a much more detailed analysis at the national level than what the questionnaire tables represent. The UNSC has agreed that the scope and pace of the implementation of the 1993 SNA must be decided by each country according to its analytical and policy needs, the resources available for implementation, and the current state of basic data.

(b) The tables reflect an equally balanced emphasis between production analysis based on supply and use information by industries on the one hand, and production, income and financial analysis based on integrated accounts for institutional sectors on the other. Thus, the behaviour of economic agents and distributional effects which are very important in explaining differences in economic structures and developments of countries can be identified.

SCOPE OF THE QUESTIONNAIRE

5. The data tables of the questionnaire are divided into five parts. Part I (Tables 1.1 to 1.3) requests summary information on gross domestic product by expenditure in current and constant prices and on the relations among product, income, saving and net lending aggregates.

6. Part II (Tables 2.1 to 2.3) of the questionnaire requests information on kind of activity breakdowns. The data series for this group of tables are requested to be reported according to the International Standard Industrial Classification of all Economic Activities, Rev. 3 (ISIC Rev. 3)[7] either as a combination of tabulation categories (A+B, G+H, J+K and M+N+O) or as single tabulation categories (A to P) (one-digit level of ISIC). Only in the case of categories A and I information at the two-digit level is requested for divisions 01, 02, 64 and the sum of the divisions 60 to 63. Where appropriate both current and constant prices are specified.

7. Part III (Tables 3.1 and 3.2) of the questionnaire requests information on functional breakdowns in current prices. The data series are requested to be reported according to the Classifications of Expenditure According to Purpose[8]. For the general government final consumption expenditure (including both individual and collective consumption expenditure), data are requested for the 10

divisions of the Classification of the Functions of Government (COFOG). For the individual consumption expenditure by households, data are requested for the first 12 divisions of the Classification of Individual Consumption According to Purpose (COICOP), which is based on the Central Product Classification (CPC)[9]. For the individual consumption expenditure by non-profit institutions serving households, data are requested for groups 13.1 through 13.6 of division 13 of COICOP. For the individual consumption expenditure by general government, data are requested for groups 14.1 through 14.5 of division 14 of COICOP.

8. Part IV (Tables 4.1 to 4.9) of the questionnaire requests information on the integrated economic accounts. The data requested in this part includes the sequence of accounts for the total economy, rest of the world and the five institutional sectors of the system, i.e. the non-financial corporations, financial corporations, general government, households, and non-profit institutions serving households. For all of the sectors as well as for the total economy data for the uses and resources as well as balancing items are requested for each of the accounts from the production account through the financial account as specified in Annex V, Part II of the 1993 SNA.

9. Part V (Table 5.1) of the questionnaire requests information on the cross-classification of gross value added by industries and institutional sectors. Data are requested to be reported for gross value added of the total economy and the five institutional sectors of the system included in Part IV cross-classified by categories of ISIC Rev. 3 as indicated in Part II above.

10. Countries are requested to update the data tables and complete them as comprehensively as possible. The tables are listed below :

Part I: Main aggregates

Table 1.1 Gross domestic product by expenditures at current prices
Table 1.2 Gross domestic product by expenditures at constant prices
Table 1.3 Relations among product, income, saving and net lending aggregates at current prices

Part II: Domestic production by industries

Table 2.1 Value added by industries at current prices
Table 2.2 Value added by industries at constant prices
Table 2.3 Output, gross value added and fixed assets by industries at current prices

Part III: Classifications of expenditure according to purpose

Table 3.1 General government final consumption expenditure by function at current prices
Table 3.2 Individual consumption expenditures at current prices

Part IV: Integrated economic accounts

Table 4.1 Total economy (S.1)
Table 4.2 Rest of the world (S.2)
Table 4.3 Non-financial corporations (S.11)
Table 4.4 Financial corporations (S.12)
Table 4.5 General government (S.13)
Table 4.6 Households (S.14)
Table 4.7 Non-profit institutions serving households (S.15)
Table 4.8 Combined Sectors: Non-Financial and Financial Corporations (S.11 + S.12)
Table 4.9 Combined Sectors: Households and NPISH (S.14 + S.15)

Part V: Cross classification of gross value added by industries and institutional sectors

Table 5.1 Cross classification of gross value added by industries and institutional sectors

11. It should be noted that the NAQ does not cover the full scope of the accounts and tables that comprise the 1993 SNA since it is mainly serves to collect data needed for global and regional analysis rather than national analysis. Also, it is in certain respects less comprehensive than the previous questionnaire based on the 1968 SNA since, for example, it does not include tables for the other changes in assets accounts and the balance sheets of the total economy and institutional sectors; the data requested on stocks of fixed assets is very limited; the tables requested broken down by kind of economic activity are less detailed, showing mainly the one-digit level of ISIC instead of the two-digit level of ISIC.

COLLECTION OF DATA

12. To collect the large volume of national accounts data, the Statistics Division annually sends a pre-filled NAQ to countries or areas. The recipients are requested to update the questionnaire with the latest available national accounts estimates and to indicate where the scope and coverage of the country estimates differ for conceptual or statistical reasons from the definitions and classifications recommended by the 1993 SNA. Data obtained from these replies are supplemented by information gathered from correspondence with the national statistical offices and from national source publications. Countries are also requested to provide a brief overview of the sources and methods to compile their national accounts.

13. In order to lighten the reporting burden of countries to different international and regional organizations the UNSD receives data from the Statistical Office of the European Commission (EUROSTAT), the Organisation for Economic Co-operation and Development (OECD), the United Nations Economic Commission for Europe (ECE) and the Caribbean Community (CARICOM) on behalf of their constituents. The UNSD, EUROSTAT and the OECD have agreed on an integrated set of national accounts questionnaires. The three organizations exchange data to a maximum extent possible. Thanks to the consistency of the 1993 SNA and the European System of Accounts (ESA 1995), all OECD countries submit data either to EUROSTAT or OECD but need not provide duplicate submissions. Member States of OECD which are not members of the European Community complete a subset of the ESA 1995 questionnaire. The ECE provides data for transition economies. CARICOM uses the NAQ to collect data from its Member States and provided it to UNSD. As a result, the United Nations questionnaire based on the 1993 SNA is sent to less than 160 countries, areas, and territories out of the 235 (of which only 193 have provided sufficient data to be published) included in the UNSD National Accounts database.

14. In order to create a comprehensive database based on the 1993 SNA, UNSD made a one-time conversion of data from the 1968 SNA format to the 1993 SNA format for all countries included in the UNSD national accounts database.

CONCEPTUAL REFERENCES AND PRESENTATION OF DATA

15. The form and concepts of the statistical tables in the present publication generally conform to the recommendations by the 1993 SNA. A summary of the conceptual framework and definitions of transactions is provided in chapter I of the present publication.

16. Although the NAQ collects data in the 1993 SNA format, countries may still use the 1968 SNA (or in some rare cases the 1953 SNA) guidelines to compile their national accounts. The UNSD evaluates the status of the conceptual adherence to the 1993 SNA from time to time.

17. The Series note at the top of each table indicates which SNA version is used by the given country to compile their national accounts. Series numbers below 100 relates to data according to the 1968 SNA data and series numbers 100 and above relates to data according to the 1993 SNA. Whenever 1968 SNA data are not replaced backwards for all years by a series of 1993 SNA data, the 1993 SNA data are presented in a new row with one overlapping year in order to allow users to link the two series. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended by the 1993 SNA, a footnote is attached to the relevant tables.

18. In the tables with constant price data (Table 1.2 and Table 2.2), the data with a new fixed base year are presented as a new sub-series in a separate row with one overlapping year. The new base year (or reference year) is indicated in the column of the year in which the new sub-series starts. An exception to this rule is chain linked volume series. Such data are presented as a single series and the respective base year is indicated for every year. For countries, which use chain linked volume series but link the data to a uniform reference year, a respective qualification is made in the country note. It has to be noted that constant price data, which are linked or chained in such a way are not additive, i.e. the total is not equivalent to the sum of its components. Also, constant price data, which are scaled up or down to a certain reference year in order to allow international comparison, are not additive.

19. In the present publication, the data for each country or area are presented in separate chapters, in alphabetical order, under uniform table headings and classifications of the 1993 SNA. Unless otherwise stated, the data in the country tables relate to the calendar year against which they are shown. The Series note at the top of each table indicates the type of fiscal year used for any given series.

COMPARABILITY OF THE NATIONAL ESTIMATES

21. Every effort has been made to present the estimates of the various countries or areas in a form designed to facilitate international comparability. To this end, important differences in concept, scope, coverage and classification have been described in the notes, which precede and accompany the country tables. Such differences should be taken into account if misleading comparison among countries or areas are to be avoided. It should also be noted that the country notes not only refer to the latest data covered in this publication but to the country in general.

REVISIONS

22. The figures shown are the most recent estimates and revisions available at the time of compilation. In general, figures for the most recent year are to be regarded as provisional.

NOMENCLATURE

23. The information for the countries and areas shown in this publication reflect what is available to the UNSD as of August 2009. Updated national accounts data are usually provided by countries to the UNSD between January and July. Data for the year 2008 is currently available for 66 countries and areas.

24. Designations, which have changed in years represented in this yearbook (1997 to 2008), are as follows:

Hong Kong - Pursuant to a Joint Declaration signed on 19 December 1994, the United Kingdom restored Hong Kong to the People's Republic of China with effect from 1 July 1997; the People's Republic of China resumed the exercise of sovereignty over the territory with effect from that date. However, China is published in this yearbook in three sections: China; China, Hong Kong; and China, Macao. The data for China excludes the special administrative regions of Hong Kong and Macao.

Zaire - All data for the former Zaire are shown under the country name of Democratic Republic of the Congo.

Serbia and Montenegro – The state union of Serbia and Montenegro dissolved in June 2006. Data for the state union of Serbia and Montenegro up to 2005 appear under Serbia and Montenegro. Available data are shown for the individual republics.

Tanzania – The data for Tanzania is published in two parts in this yearbook: mainland Tanzania and Zanzibar. Note that the data listed under Tanzania does not include Zanzibar.

SYMBOLS AND DATA DISPLAY

25. The following symbols have been employed:

Data not available..... [...]

Magnitude nil or less than five percent of the unit employed..... **[0.0]**

Decimal figures are always preceded by a point [.]

26. Each series version is presented in a separate row and identified by a series number in the column of the year in which it starts. A new series version is introduced if the data displayed differs from preceding data in terms of methodology, fiscal-year type or currency. A Series note at the top of each table informs about the SNA version applied, currency denomination, and fiscal-year type used. The scale used to present the data is displayed at the top right of each table.

27. Decimals in tables do not necessarily add to totals shown because of rounding.

GENERAL DISCLAIMER

28. The designations employed and the presentation of material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers and boundaries.

29. Where the designation "country or area" appears in the headings of tables, it covers countries, territories, cities or areas. In prior issues of this publication where the designation "country" appears in the headings of tables, it covers countries, territories, cities or areas

I. SYSTEM OF NATIONAL ACCOUNTS

1. The origins of the System of National Accounts (SNA) trace back to the 1947 Report of the Sub-Committee on National Income Statistics of the League of Nations Committee of Statistical Experts under the leadership of Richard Stone[1]. At its first session in 1947, the United Nations Statistical Commission emphasized the need for international statistical standards for the compilation and updating of comparable statistics in support of a large array of policy needs. Specifically, the Commission recommended that the United Nations Statistical Office, in consultation with the interested specialized agencies, should work on guidelines for national accounts statistics (national income and expenditure), taking into consideration best practises and international comparability[2]. In view of the emphasis on international statistical standards, the first national accounts standard was produced and published in 1953. The SNA was subsequently revised and updated in 1960, 1964, 1968 and 1993. In 2003 the United UNSC called for an update of the 1993 SNA. The System of National Accounts 2008[3], (in short the 2008 SNA) was finalised in September 2009. This chapter describes the concepts and definitions of the SNA as recommended by the 1993 SNA.

A. THE SNA AS A SYSTEM

2. The System of National Accounts (SNA) consists of a coherent, consistent and integrated set of macroeconomic accounts, balance sheets and tables based on a set of internationally agreed concepts, definitions, classifications and accounting rules. It provides a comprehensive accounting framework within which economic data can be compiled and presented in a format that is designed for purposes of economic analysis, decision-taking and policy-making. The accounts themselves present in a condensed way a great mass of detailed information, organized according to economic principles and perceptions, about the working of an economy. They provide a comprehensive and detailed record of the complex economic activities taking place within an economy and of the interaction between the different economic agents, and groups of agents that takes place on markets or elsewhere. In practice the accounts are compiled for a succession of time periods, thus providing a continuing flow of information that is indispensable for the monitoring, analysis and evaluation of the performance of an economy over time. The SNA provides information not only about economic activities, but also about the levels of an economy's productive assets and the wealth of its inhabitants at particular points of time. Finally, the SNA includes an external account that displays the links between an economy and the rest of the world.

3. The SNA may be implemented at different levels of aggregation: at the level of individual economic agents, or institutional units as they are called in the System; for groups of such units, or institutional sectors; or at the level of the total economy. Although traditionally described as a system of national accounts, for analytical purposes the SNA has to be implemented at lower levels of aggregation. In order to understand the workings of the economy, it is essential to be able to observe and analyse the economic interactions taking place between the different sectors of the economy. Certain key aggregate statistics, such as gross domestic product (GDP), that are widely used as indicators of economic activity at the level of the total economy, are defined within the System, but the calculation of such aggregates has long ceased to be the primary purpose for compiling the accounts.

4. The System is built around a sequence of interconnected flow accounts linked to different types of economic activity taking place within a given period of time, together with balance sheets that record the values of the stocks of assets and liabilities held by institutional units or sectors at the beginning and end of the period. Each flow account relates to a particular kind of activity such as production, or the generation, distribution, redistribution or use of income. Each account is balanced by introducing a balancing item defined residually as the difference between the total resources and uses recorded on the two sides of the account. The balancing item from one account is carried forward as the first item in the following account, thereby making the sequence of accounts an articulated whole. The balancing items typically encapsulate the net result of the activities covered by the accounts in question and are therefore economic constructs of considerable interest and analytical significance - for example, value added, disposable income and saving. There is also a strong link between the flow accounts and the balance sheets, as all the changes occurring over time that affect the assets or liabilities held by institutional units or sectors are systematically recorded in one or another of the flow accounts. The closing balance sheet is fully determined by the opening balance sheet and the transactions or other flows recorded in the sequence of accounts.

B. ACCOUNTS AND THEIR CORRESPONDING ECONOMIC ACTIVITIES

5. The purpose of this section is to give a very brief summary of the main sequence of accounts in order to

describe the main features of the System before discussing other related issues. It is impossible to do justice to the wealth of information contained in the System in a short section of this kind, and reference should be made to chapter II of the 1993 SNA for a comprehensive overview of the System.

1. The sequence of accounts

Current accounts

6. These accounts record the production of goods and services, the generation of incomes by production, the subsequent distribution and redistribution of incomes among institutional units, and the use of incomes for purposes of consumption or saving.

Production account

7. The production account records the activity of producing goods and services as defined within the System. Its balancing item, gross value added, is defined as the value of output less the value of intermediate consumption and is a measure of the contribution to GDP made by an individual producer, industry or sector. Gross value added is the source from which the primary incomes of the System are generated and is therefore carried forward into the primary distribution of income account. Value added may also be measured net by deducting consumption of fixed capital.

Distribution and use of income accounts

8. These consist of a set of articulated accounts showing how incomes are:

Generated by production

Distributed to institutional units with claims on the value added created by production

Redistributed among institutional units, mainly by government units through social security contributions and benefits and taxes

Eventually used by households, government units or non-profit institutions serving households (NPISHs) for purposes of final consumption or saving.

9. The balancing item emerging from the complete set of income accounts is saving. The income accounts have considerable intrinsic economic interest in themselves. In particular, they are needed to explain the behaviour of institutional units as final consumers - that is, as users of the goods and services emanating from production for the satisfaction of the individual and collective needs and wants of households and the community. The balancing item, saving, is carried forward into the capital account, the first in the System's sequence of accumulation accounts.

Accumulation accounts

10. These are flow accounts that record the acquisition and disposal of financial and non-financial assets and liabilities by institutional units through transactions or as a result of other events:

The capital account records acquisitions and disposals of non-financial assets as a result of transactions with other units or internal bookkeeping transactions linked to production (changes in inventories and consumption of fixed capital).

The financial account records acquisitions and disposals of financial assets and liabilities, also through transactions.

A third account, the other changes in assets account, consists of two sub-accounts. The first, the other changes in volume of assets account, records changes in the amounts of the assets and liabilities held by institutional units or sectors as a result of factors other than transactions; for example, destruction of fixed assets by natural disasters. The second, the revaluation account, records those changes in the values of assets and liabilities that result from changes in their prices.

11. The link between the accumulation accounts and the income accounts is provided by the fact that saving - that is, disposable income that is not spent on consumption goods or services - must be used to acquire financial or non-financial assets of one kind or another, if only cash, the most liquid financial asset. When saving is negative, the excess of consumption over disposable income must be financed by disposing of assets or incurring liabilities. The financial account shows the way in which funds are channelled from one group of units to another, especially through financial intermediaries. Access to finance is a prerequisite for engaging in many types of economic activities.

Balance sheets

12. The balance sheets show the values of the stocks of assets and liabilities held by institutional units or sectors at the beginning and end of an accounting period. As already noted, the values of the assets and liabilities held at any moment in time vary automatically whenever

any transactions, price changes or other changes affecting the volume of assets or liabilities held take place. These are all recorded in one or another of the accumulation accounts so that the difference between the values in the opening and closing balance sheets is entirely accounted for within the System, provided, of course, that the assets and liabilities recorded in the balance sheets are valued consistently with the transactions and other changes - that is, at current prices.

2. Activities and transactions

13. The accounts of the System are designed to provide analytically useful information about the behaviour of institutional units and the activities in which they engage, such as production, consumption and the accumulation of assets. They usually do this by recording the values of the goods, services or assets involved in the transactions between institutional units that are associated with these activities rather than by trying to record or measure the physical processes directly. For example, the accounts do not record the physical consumption of goods and services by households - the eating of food or the burning of fuel within a given time period. Instead, they record the expenditures that households make on final consumption goods and services or, more generally, the values of the goods and services they acquire through transactions with other units, whether purchased or not. Data on transactions provide the basic source material from which the values of the various elements in the accounts are built up or derived. The use of transactions data has important advantages. First, the prices at which goods and services are exchanged in transactions between buyers and sellers on markets provide the information needed for valuing, directly or indirectly, all the items in the accounts. Secondly, a transaction that takes place between two different institutional units has to be recorded for both parties to the transaction and therefore generally appears twice in a system of macroeconomic accounts. This enables important linkages to be established in the System. For example, output is obtained by summing the amounts sold, bartered or transferred to other units plus the amounts entered into, less the amounts withdrawn from inventories. In effect, the value of output is obtained by recording the various uses of that output by means of data on transactions. In this way, flows of goods and services can be traced through the economic system from their producers to their eventual users. Some transactions are only internal bookkeeping transactions that are needed when a single unit engages in two activities, such as the production and consumption of the same good or service, but the great majority of transactions take place between different units on markets.

C. THE INSTITUTIONAL SECTORS OF THE ECONOMY

14. The purpose of this section is to indicate very briefly the main sectors of the economy for which it is possible to compile the full sequence of accounts summarized in the previous section. Two main kinds of institutional units, or transactors, are distinguished in the System - households and legal entities. The latter are either entities created for purposes of production, mainly corporations and non-profit institutions (NPIs), or government units, including social security funds. Institutional units are essentially units that are capable of owning goods and assets, incurring liabilities and engaging in economic activities and transactions with other units in their own right. For the purposes of the System, institutional units that are resident in the economy are grouped together into five mutually exclusive sectors composed of the following types of units:

Non-financial corporations

Financial corporations

Government units, including social security funds

NPIs serving households (NPISHs)

Households.

The five sectors together make up the total economy. Each sector is also divided into sub-sectors. For example, the non-financial and financial corporations sectors are divided to distinguish corporations subject to control by governments or foreign units from other corporations. The System makes provision for a complete set of flow accounts and balance sheets to be compiled for each sector, and sub-sector if desired, as well as for the total economy. The total number of accounts that may be compiled is therefore potentially quite large, depending upon the level of disaggregation that is required and feasible. Only by disaggregation into sectors and sub-sectors is it possible to observe the interactions between the different parts of the economy that need to be measured and analysed for purposes of policy-making. The complete set of accounts at the level of the five main sectors is shown in annex V of the 1993 SNA.

15. Institutional units that are resident abroad form the rest of the world. The System does not require accounts to be compiled in respect of economic activities taking place in the rest of the world, but all transactions between resident and non-resident units have to be recorded in order to obtain a complete accounting for the

economic behaviour of resident units. Transactions between residents and non-residents are grouped together in a single account, the rest of the world account.

D. OTHER FEATURES OF THE SYSTEM

16. The SNA is a rich and detailed economic accounting system that extends well beyond the main sequence of accounts to encompass other accounts or tables that either contain information that cannot be included in the main accounts or present information in alternative ways, such as matrices, that may be more appropriate for certain types of analysis. It is not proposed to list all these various elements at this point, as they are described in chapter II of the 1993 SNA, but it is useful to draw attention to two specific elements which play a major role in the System.

1. Supply and use tables

17. In addition to the flow accounts and balance sheets described earlier, the central framework of the System also contains detailed supply and use tables in the form of matrices that record how supplies of different kinds of goods and services originate from domestic industries and imports and how those supplies are allocated between various intermediate or final uses, including exports. These tables involve the compilation of a set of integrated production and generation of income accounts for industries - that is, groups of establishments as distinct from institutional units - that are able to draw upon detailed data from industrial censuses or surveys. The supply and use tables provide an accounting framework within which the commodity flow method of compiling national accounts - in which the total supplies and uses of individual types of goods and services have to be balanced with each other - can be systematically exploited. The supply and use tables also provide the basic information for the derivation of detailed input-output tables that are extensively used for purposes of economic analysis and projections.

2. Price and volume measures

18. The System also provides specific guidance about the methodology to be used to compile an integrated set of price and volume indices for flows of goods and services, gross value added and GDP that are consistent with the concepts and accounting principles of the System. It is recommended that annual chain indices should be used where possible, although fixed base indices may also be used when the volume measures for components and aggregates have to be additively consistent for purposes of economic analysis and modelling.

19. Rates of inflation and economic growth appropriately measured by price and volume indices for the main aggregates of the System are key variables both for the evaluation of past economic performance and as targets for the formulation of economic policy-making. They are an essential part of the System, especially given the emergence of inflation as an endemic economic problem in many countries. The System also recognizes that the growth in the volume of GDP and the growth of an economy's real income are not the same because of trading gains or losses resulting from changes in international terms of trade.

E. CONCEPTS

20. The contents of the SNA depend not only on the accounting structure itself - that is, on the type and format of the accounts - but also on the ways in which the items included in the accounts are defined and classified. The issues involved are not simply of a technical nature but raise fundamental questions of economic theory and principles. The concepts and classifications used in the System have a considerable impact on the ways in which the data may be used and the interpretations placed on them.

1. The production boundary

21. The activity of production is fundamental. In the System, production is understood to be a physical process, carried out under the responsibility, control and management of an institutional unit, in which labour and assets are used to transform inputs of goods and services into outputs of other goods and services. All goods and services produced as outputs must be such that they can be sold on markets or at least be capable of being provided by one unit to another, with or without charge. The System includes within the production boundary all production actually destined for the market, whether for sale or barter. It also includes all goods or services produced and provided free to individual households or collectively to the community by government units or NPISHs.

Household production

22. The main problem for defining the range of activities recorded in the production accounts of the System is to decide upon the treatment of activities that produce goods or services that could have been supplied to others on the market but are actually retained by their producers for their own use. These cover a very wide range of productive activities, in particular:

(a) The production of agricultural goods by household enterprises for own final consumption;

(b) The production of other goods for own final use by households: the construction of dwellings, the production of foodstuffs and clothing, etc;
(c) The production of housing services for own final consumption by owner occupiers;

(d) The production of domestic and personal services for consumption within the same household: the preparation of meals, care and training of children, cleaning, repairs, etc.

All of these activities are productive in an economic sense. However, inclusion in the System is not simply a matter of estimating monetary values for the outputs of these activities. If values are assigned to the outputs, values have also to be assigned to the incomes generated by their production and to the consumption of the output. It is clear that the economic significance of these flows is very different from that of monetary flows. For example, the incomes generated are automatically tied to the consumption of the goods and services produced; they have little relevance for the analysis of inflation or deflation or other disequilibria within the economy. The inclusion of large non-monetary flows of this kind in the accounts together with monetary flows can obscure what is happening on markets and reduce the analytic usefulness of the data.

23. The SNA is a multi-purpose system. It is designed to meet wide a range of analytical and policy needs. A balance has to be struck between the desire for the accounts to be as comprehensive as possible and the need to prevent flows used for the analysis of market behaviour and disequilibria from being swamped by non-monetary values. The System therefore includes all production of goods for own use within its production boundary, as goods can be switched between market and non-market use even after they have been produced, but it excludes all production of services for own final consumption within households (except for the services produced by employing paid domestic staff and the own-account production of housing services by owner occupiers). These services are consumed as they are produced and the links between their production and market activities are more tenuous than for goods production, such as agricultural goods which households may produce partly for own final consumption and partly for sale, or barter, on the market. The location of the production boundary in the System is a compromise, but a deliberate one that takes account of the needs of most users. In this context it may be noted that in labour force statistics economically active persons are defined as those engaged in productive activities as defined in the SNA. If the production boundary were extended to include the production of personal and domestic services by members of households for their own final consumption, all persons engaged in such activities would become self-employed, making unemployment virtually impossible by definition. This illustrates the need to confine the production boundary in the SNA and other related statistical systems to market activities or fairly close substitutes for market activities.

Other production boundary problems

24. Certain natural processes may or may not be counted as production depending upon the circumstances in which they occur. A necessary condition for an activity to be treated as productive is that it must be carried out under the instigation, control and responsibility of some institutional unit that exercises ownership rights over whatever is produced. For example, the natural growth of stocks of fish in open seas is not counted as production: the process is not managed by any institutional unit and the fish do not belong to any institutional unit. On the other hand, the growth of fish in fish farms is treated as a process of production in much the same way that rearing livestock is a process of production. Similarly, the natural growth of wild, uncultivated forests or wild fruits or berries is not counted as production, whereas the cultivation of crop-bearing trees, or trees grown for timber or other uses, is counted in the same way as the growing of annual crops. However, the deliberate felling of trees in wild forests, and the gathering of wild fruit or berries, and also firewood, counts as production. Similarly, rainfall and the flow of water down natural watercourses are not processes of production, whereas storing water in reservoirs or dams and the piping, or carrying, of water from one location to another all constitute production.

25. These examples show that many activities or processes that may be of benefit to institutional units, both as producers and consumers, are not processes of production in an economic sense. Rainfall may be vital to the agricultural production of a country but it is not a process of production whose output can be included in GDP.

2. The consumption boundary

26. The coverage of production in the System has ramifications that extend considerably beyond the production account itself. The boundary of production determines the amount of value added recorded and hence the total amount of income generated by production. The range of goods and services that are included in household final consumption expenditures, and actual consumption, is similarly governed by the production boundary; for example, these expenditures include the estimated values of the agricultural products consumed by

households that they have produced themselves and also the values of the housing services consumed by owner occupiers, but not the values of "do-it-yourself" repairs and maintenance to vehicles or household durables, the cleaning of dwellings, the care and training of children, or similar domestic or personal services produced for own final consumption. Only the expenditures on goods utilized for these purposes - e.g., cleaning materials - are included in household final consumption expenditures.

3. The asset boundary

27. Balance sheets are compiled for institutional units, or sectors, and record the values of the assets they own or the liabilities they have incurred. Assets as defined in the System are entities that must be owned by some unit, or units, and from which economic benefits are derived by their owner(s) by holding or using them over a period of time. Financial assets and fixed assets are clearly covered by this definition. However, the ownership criterion is important for determining which naturally occurring - i.e., non-produced - assets are included in the System. Naturally occurring assets such as land, mineral deposits, fuel reserves, uncultivated forests or other vegetation and wild animals are included in the balance sheets provided that institutional units are exercising effective ownership rights over them - that is, are actually in a position to be able to benefit from them. Assets need not be privately owned and could be owned by government units exercising ownership rights on behalf of entire communities. Thus, many environmental assets are included within the System. Assets that are not included are those such as the atmosphere or open seas, over which no ownership rights can be exercised, or mineral or fuel deposits that have not been discovered or that are unworkable - i.e., incapable of bringing any benefits to their owners, given the technology and relative prices existing at the time.

28. Changes in the values of naturally occurring assets owned by institutional units between one balance sheet and the next are recorded in the accumulation accounts of the System. For example, the depletion of a natural asset as a result of its use in production is recorded in the other changes in volume of assets account, together with losses of fixed assets due to their destruction by natural disasters (floods, earthquakes, etc.). Conversely, when deposits or reserves of minerals or fuels are discovered or previously unworkable deposits become workable, their appearance is recorded in this account and they enter the balance sheets in this way.

4. National boundaries

29. The accounts of the System are compiled for resident institutional units grouped into institutional sectors and sub-sectors. The concept of residence is the same as that used in the Balance of Payments Manual of the International Monetary Fund (IMF). An institutional unit is said to be resident within the economic territory of a country when it maintains a centre of economic interest in that territory - that is, when it engages, or intends to engage, in economic activities or transactions on a significant scale either indefinitely or over a long period of time, usually interpreted as one year. As an aggregate measure of production, the GDP of a country is equal to the sum of the gross values added of all resident institutional units engaged in production (plus any taxes, and minus any subsidies, on products not included in the value of their outputs). This is not exactly the same as the sum of the gross values added of all productive activities taking place within the geographical boundaries of the national economy. Some of the production of a resident institutional unit may take place abroad - for example, the installation of some exported machinery or equipment or a consultancy project undertaken by a team of expert advisers working temporarily abroad. Conversely, some of the production taking place within a country may be attributable to foreign institutional units.

F. USES OF THE SNA

30. The SNA is a multi-purpose system, as stated above, designed for economic analysis, decision-taking and policy-making, whatever the industrial structure or stage of economic development reached by a country. The basic concepts and definitions of the System depend upon economic reasoning and principles which should be universally valid and invariant to the particular economic circumstances in which they are applied. Similarly, the classifications and accounting rules are meant to be universally applicable. There is no justification, for example, for seeking to define the components of a production account - output, intermediate consumption and gross value added - differently in less developed than in more developed economies, or in large relatively closed economies than in small open economies, or in high- inflation economies than in low-inflation economies. Certain definitions, or accounting rules, specified in the System may become superfluous in certain circumstances (e.g., when there is no inflation), but it is nevertheless necessary for a general system such as the SNA to include definitions and rules covering as wide a range of circumstances as possible.

31. The fact that data needs and priorities, and also statistical capabilities, may vary considerably between different kinds of countries does not justify the construction of different systems with different concepts, definitions, classifications or accounting rules. Some countries may be able, at least initially, to calculate only a small number of accounts and tables for the total

economy with little or no disaggregation into sectors, but a reduced set of accounts or tables does not constitute an alternative system. It is not appropriate to try to lay down general priorities for data collection when economic circumstances may vary so much from one country to another. In practice, priorities can only be established country by country by economic analysts or policy-makers familiar with the economic situation, needs and problems of the individual countries in question. It is not useful, for example, to try to specify general priorities for developing countries when they constitute a very heterogeneous group of countries at a world level. Data priorities may vary as much between one developing country and another as between a developing and a developed country.

1. Specific uses

32. The main objective of the SNA is to provide a comprehensive conceptual and accounting framework which can be used to create a macroeconomic database suitable for analysing and evaluating the performance of an economy. The existence of such a database is a prerequisite for informed, rational policy-making and decision-taking. Some of the more specific uses of the SNA are described in the following sections.

Monitoring the behaviour of the economy

33. National accounts data provide information covering both different types of economic activities and the different sectors of the economy. It is possible to monitor the movements of major economic flows such as production, household consumption, government consumption, capital formation, exports, imports, wages, profits, taxes, lending, borrowing, etc., the flows of goods and services being recorded at both current and constant prices. Moreover, information is provided about certain key balancing items and ratios which can only be defined and measured within an accounting framework - for example, the budget surplus or deficit, the share of income which is saved, or invested, by individual sectors of the economy or the economy as a whole, the trade balance, etc. National accounts also provide the background against which movements of short-term indicators, such as monthly indices of industrial production or of consumer or producer prices, can be interpreted and evaluated. The monitoring of the behaviour of the economy may be significantly improved if at least some of the main aggregates of the System are compiled quarterly as well as annually, although many of the accounts, tables or balance sheets of the System are not usually compiled more frequently than once a year.

Macroeconomic analysis

34. National accounts are also used to investigate the causal mechanisms at work within an economy. Such analysis usually takes the form of the estimation of the parameters of functional relationships between different economic variables by applying econometric methods to time series of data at both current and constant prices compiled within a national accounting framework. The types of macroeconomic models used for such investigations may vary according to the school of economic thought of the investigator as well as the objectives of the analysis, but the System is sufficiently flexible to accommodate the requirements of different economic theories or models, provided only that they accept the basic concepts of production, consumption, income, etc. on which the System is based.

35. Advances in computer technology have made it possible for the econometric analysis of large macroeconomic models to be carried out on microcomputers. Many econometric software packages have been developed for this purpose so that this kind of modelling is no longer confined to a few government departments, research institutes or universities with large mainframe computers. It is increasingly being undertaken by private corporations or institutions with only limited resources available for these purposes.

Economic policy-making and decision-taking

36. Economic policy in the short term is formulated on the basis of an assessment of the recent behaviour and current state of the economy and a view, or precise forecast, about likely future developments. Short-term forecasts are typically made using econometric models of the type just described. Over the medium- or long-term, economic policy has to be formulated in the context of a broad economic strategy which may need to be quantified in the form of a plan. Most of the elements which make up a medium- or long-term economic plan consist of national accounts flows, and it may be impossible to draw up such a plan without them. A good macroeconomic model which accurately reflects the past performance of the economy may be indispensable for planning as well as forecasting.

37. Economic policy-making and decision-taking take place at all levels of government and also within public and private corporations. Large corporations such as multinationals have the ability to build their own macroeconomic models tailored to their own requirements, for which they need national accounts data. The investment programmes of major corporations must be based on long-term expectations about future economic developments that require national accounts data. There are also, of course, specialist agencies that provide forecasts for individual clients in return for fees.

Such agencies typically require very detailed national accounts data.

International comparisons

38. The SNA is the system used for reporting to international or supranational organizations national accounts data that conform to standard, internationally accepted concepts, definitions and classifications. The resulting data are widely used for international comparisons of the volumes of major aggregates, such as GDP or GDP per head, and also for comparisons of structural statistics, such as ratios of investment, taxes or government expenditures to GDP. Such comparisons are used by economists, journalists or other analysts to evaluate the performance of one economy against that of other similar economies. They can influence popular and political judgements about the relative success of economic programmes in the same way as developments over time within a single country. Databases consisting of sets of national accounts for groups of countries can also be used for econometric analyses in which time-series and cross-section data are pooled to provide a broader range of observations for the estimation of functional relationships.

39. Levels of GDP or, alternatively, gross national income (GNI) per head in different countries are also used by international organizations to determine eligibility for loans, aid or other funds or to determine the terms or conditions on which such loans, aid or funds are made available. When the objective is to compare the volumes of goods or services produced or consumed per head, data in national currencies must be converted into a common currency by means of purchasing power parities and not exchange rates. It is well known that, in general, neither market nor fixed exchange rates reflect the relative internal purchasing powers of different currencies. When exchange rates are used to convert GDP, or other statistics, into a common currency the prices at which goods and services in high-income countries are valued tend to be higher than in low-income countries, thus exaggerating the differences in real incomes between them. Exchange rate converted data must not, therefore, be interpreted as measures of the relative volumes of goods and services concerned. Levels of GDP, or GDP per head, in different countries are also used to determine, in whole or in part, the size of the contributions which the member countries of an international organization make to finance the operations of the organization.

40. Although international organizations use the SNA in order to be able to collect internationally comparable national accounts data, the SNA has not been created for this purpose. It has become the standard, or universal, system used with little or no modification by most countries in the world for their own national purposes. National statistical offices and government agencies have a strong vested interest in ensuring that the SNA meets their own analytic and policy requirements and have taken an active part in the development of the System for this reason.

2. Flexibility of implementation and use

41. The SNA is designed to be sufficiently comprehensive that individual countries, whatever their economic structures, institutional arrangements or level of development, can select from within it those parts of the System which are considered to be most relevant and useful to implement in the light of their own needs and capabilities. The SNA is meant to be implemented in a flexible manner and the accounts and tables, classifications and sectoring presented in this volume should not be regarded as fixed. In some cases, the System explicitly insists on flexibility. For example, two alternative methods of sub-sectoring the general government sector are proposed in chapter IV of the 1993 SNA without either being assigned priority. Similarly, although the System suggests sub-sectoring the households sector on the basis of the household's principal source of income, it stresses that this is only one possible criterion for sub-sectoring. In some cases, it may be more appropriate to sub-sector on the basis of socio-economic criteria or the type of area in which the household is located or, indeed, to carry the disaggregation of the households sector further by using two or more criteria together in a hierarchical manner.

42. Ways in which the System may be adapted to meet differing circumstances and needs are specifically addressed in chapter XIX of the 1993 SNA. For example, classifications of institutional units, transactions and assets may be implemented flexibly in order to adapt them to the data availability and special circumstances of different countries. The flexible use of classifications does not change the basic concepts and definitions of the System. However, as explained in chapter XXI of the 1993 SNA, flexibility may be taken a stage further by developing satellite accounts that are closely linked to the main System but are not bound to employ exactly the same concepts or restricted to data expressed in monetary terms. Satellite accounts are intended for special purposes such as monitoring the community's health or the state of environment. They may also be used to explore new methodologies and to work out new accounting procedures that, when fully developed and accepted, may become absorbed into the main System in the course of time, in the way that input-output analysis, for example, has been integrated into the System.

43. Another way in which the System may be implemented flexibly is by rearranging the data in the accounts in the form of a social accounting matrix in order better to serve particular analytical and policy needs. Such matrices should not be construed as constituting different systems but as alternative ways of presenting the mass of information contained in the System which many users and analysts find more informative and powerful for both monitoring and modelling social and economic development.

3. The SNA as a coordinating framework for statistics

44. The System also has a very important statistical function by serving as a coordinating framework for economic statistics in two different senses: first, as the conceptual framework for ensuring the consistency of the definitions and classifications used in different, but related, fields of statistics, and secondly, as an accounting framework for ensuring the numerical consistency of data drawn from different sources, such as industrial inquiries, household surveys, merchandise trade statistics, VAT returns and other administrative sources.

G. HARMONIZATION BETWEEN DIFFERENT STATISTICAL SYSTEMS

45. The SNA and related statistical systems need to be as consistent as possible in respect of their basic concepts, definitions and classifications. National accounts have always occupied a central position in economic statistics because the data from more specialized systems, such as balance of payments or labour force statistics, typically have to be used in conjunction with national accounts data. Consistency between the different systems enhances the analytical usefulness of all the statistics involved. The harmonization of the SNA and related statistical systems, such as financial statistics or balance of payments statistics, has been one of the driving forces behind revisions of the System.

46. Revisions of other statistical systems have been conducted in parallel with, and in close collaboration with, that of the SNA in order to eliminate conceptual differences between them other than a few exceptions that can be specifically justified in terms of the special characteristics of different kinds of data, or the special requirements of different kinds of users. Harmonization between the SNA and other major systems has been largely successful and has been achieved by making changes to the SNA as well as to the other systems.

47. Because of the active involvement of the IMF in the revision of the 1993 SNA, the harmonization process has been particularly effective in respect of balance of payments statistics, government finance statistics and money and banking statistics, for which the IMF has responsibility. Revisions of each of these three systems are being undertaken by the IMF in order not only to update these systems but also to make them consistent with the 1993 SNA to the fullest extent possible. Revised manuals on these systems are being published at about the same time as, or in the years immediately following, the 1993 SNA.

48. Various other revised international guidelines are being issued at about the same time as the 1993 SNA. These include the third revision of the United Nations International Standard Industrial Classification of All Economic Activities (ISIC), the industrial classification that is used in the 1993 SNA. The establishment as described in ISIC is also the statistical unit used to compile the production accounts by industry that make up supply and use tables of the SNA, the concept of the establishment being the same in both the SNA and ISIC. The International Labour Organisation (ILO) has issued revised standards on labour statistics that define employment in a way that is consistent with the boundary of production in the SNA, as summarized earlier in this chapter. An extract from the resolution of the Fifteenth International Conference of Labour Statisticians concerning the distinction between the formal and informal sectors is reproduced as an annex to chapter IV of the 1993 SNA. Another example is provided by the revised Handbook on Agricultural Accounts, prepared by the Food and Agricultural Organization of the United Nations (FAO), which has been brought into line with the treatment of agricultural products and activities in the SNA. It is neither necessary nor feasible to list here all the revisions to international statistical systems and standards that are being undertaken or planned as it is the policy of all the various international agencies involved at a world level to harmonize these systems with each other and with the SNA to the fullest extent possible.

H. IMPLEMENTATION OF CONCEPTS

49. The contents of the accounts are determined not only by the conceptual framework, definitions and classifications of the System but also by the ways in which they are interpreted and implemented in practice. However simple and precise concepts and classifications may appear in principle, there are inevitably difficult borderline cases which cannot easily be fitted into predetermined categories. These points may be illustrated by considering a fundamental distinction in economics and in the System, namely, the distinction between consumption and gross fixed capital formation (or gross fixed investment, as it is often described in other contexts).

1. Final consumption, intermediate consumption and gross fixed capital formation

50. Consumption is an activity in which institutional units use up goods or services. There are two quite different kinds of consumption. Intermediate consumption consists of inputs into processes of production that are used up within the accounting period. Final consumption consists of goods and services used by individual households or the community to satisfy their individual or collective needs or wants. The activity of gross fixed capital formation, on the other hand, is restricted to institutional units in their capacity as producers, being defined as the value of their acquisitions less disposals of fixed assets. Fixed assets are produced assets (mostly machinery, equipment, buildings or other structures but also including some intangible assets) that are used repeatedly or continuously in production over several accounting periods (more than one year).

51. The general nature and purpose of the distinction between gross fixed capital formation and consumption, whether intermediate or final, is clear. The distinction is fundamental for economic analysis and policy-making. Nevertheless, the borderline between consumption and gross fixed capital formation is not always easy to determine in practice. Certain activities contain some elements that appear to be consumption and at the same time others that appear to be capital formation. In order to try to ensure that the System is implemented in a uniform way decisions have to be taken about the ways in which certain difficult, even controversial, items are to be classified. Some examples are given below.

Training, research and development

52. Expenditures by enterprises on activities such as staff training or research and development are not the type of intermediate inputs whose consumption is determined by the level at which production is carried out in the current period but are designed to raise productivity or increase the range of production possibilities in the future, in much the same way as expenditures on machinery, equipment, buildings and other structures. However, expenditures on training and research or development do not lead to the acquisition of assets that can be easily identified, quantified and valued for balance sheet purposes. Such expenditures continue to be classified as intermediate consumption, therefore, even though it is recognized that they may bring future benefits. In fact, many other expenditures undertaken by enterprises may also have impacts in future periods as well as the current period - for example, market research, advertising and expenditures on health and safety that affect the well-being and attitudes of the workforce.

Education

53. It is often proposed that expenditures on education should also be classified as gross fixed capital formation as a form of investment in human capital. The acquisition of knowledge, skills and qualifications increases the productive potential of the individuals concerned and is a source of future economic benefit to them. However, while knowledge, skills and qualifications are clearly assets in a broad sense of the term, they cannot be equated with fixed assets as understood in the System. They are not produced because they are acquired through learning, studying and practising - activities that are not themselves processes of production. The education services produced by schools, colleges, universities, etc. are consumed by students in the process of their acquiring knowledge and skills. Education assets are embodied in individuals as persons. They cannot be transferred to others and cannot be shown in the balance sheets of the enterprises in which the individuals work (except in rare cases when certain highly skilled individuals are under contract to work for particular employers for specified periods). Education assets could possibly be shown in balance sheets for the individuals in which they are embodied, but individuals are not enterprises. They would be difficult to value, bearing in mind that the remuneration received by a skilled worker depends upon the amount of time and effort expended and is not simply a return payable to the owner of an asset.

54. It may also be noted that final consumption consists of the use of goods and services for the direct satisfaction of human needs or wants, individually or collectively. Education services are undoubtedly consumed in this sense. They increase the welfare and improve the general quality of life of those consuming them. Moreover, they are not the only services consumed by individuals to bring long- as well as short-term benefits. For example, the consumption of health services brings long-term benefits and even the consumption of basic items such as food and housing is necessary in order to keep an individual in good health - and good working order.

Repairs, maintenance and gross fixed capital formation

55. Another, less familiar, example of the intrinsic difficulty of trying to draw a dichotomy between consumption and gross fixed capital formation is provided by repairs and maintenance. Ordinary maintenance and repairs undertaken by enterprises to keep fixed assets in good working order are intermediate consumption. However, major improvements, additions or extensions to fixed assets, both machinery and structures, which improve their performance, increase their capacity or

prolong their expected working lives count as gross fixed capital formation. In practice it is not easy to draw the line between ordinary repairs and major improvements, although the System provides certain guidelines for this purpose. Some analysts, however, consider that the distinction between ordinary repairs and maintenance and major improvements and additions is neither operational nor defensible and would favour a more "gross" method of recording in which all such activities are treated as gross fixed capital formation.

2. Interpretation of the distinction between consumption and gross fixed capital formation

56. The examples given above show that a simple dichotomy between consumption and gross fixed capital formation inevitably presents problems when dealing with flows of goods and services that do not fit comfortably under either heading. The issue is not simply how to classify certain flows, but also how to achieve an economically meaningful and feasible set of accounting procedures for the assets acquired through gross fixed capital formation within an integrated, coherent set of accounts encompassing past and future periods as well as the present.

57. Some care and sophistication is needed in using the accounts. For example, goods and services "consumed" by households - i.e., acquired for the satisfaction of their needs or wants - are not suddenly "used up" and do not "vanish" at the moment of acquisition. In particular, households "consuming" services such as health and education may continue to derive benefits over long periods of time. The "consumption" of such services therefore has points of similarity with "investment" in assets. Similarly, enterprises may continue to benefit over long periods of time from the intermediate consumption of services such as maintenance and repairs, training, research and development, market research, etc. Thus, while the acquisition of fixed assets by enterprises - that is, gross fixed capital formation - is undertaken specifically to enhance future production possibilities, they are not the only types of expenditure that may be expected to bring future benefits.

58. The decision whether to classify certain types of expenditure by households or government, such as education or health services, as final consumption expenditures or gross fixed capital formation does not affect the size of GDP, as both are final expenditures. On the other hand, the decision to classify certain expenditures by enterprises as intermediate consumption rather than gross fixed capital formation does reduce the gross value added and operating surplus of the enterprise and hence GDP as a whole. However, treating certain expenditures as intermediate reduces not only gross fixed capital formation but also consumption of fixed capital in subsequent periods. It is therefore an open question as to how net value added and net domestic product (NDP) are affected in the longer term, depending upon the pattern of the relevant expenditures over time.

I. DEFINITIONS OF IMPORTANT TERMS (GLOSSARY)

Acquisitions

Goods and services are acquired by institutional units when they become the new owners of the goods or when the delivery of services to them is completed.

Actual final consumption of general government

Actual final consumption of general government is measured by the value of the collective (as opposed to individual) consumption services provided to the community, or large sections of the community, by general government; it is derived from their final consumption expenditure by subtracting the value of social transfers in kind payable.

Actual final consumption of households

Actual final consumption of households is the value of the consumption goods acquired by households, whether by purchase in general, or by transfer from government units or NPISHs, and used by them for the satisfaction of their needs and wants; it is derived from their final consumption expenditure by adding the value of social transfers in kind receivable.

Actual final consumption of NPISHs

NPISHs have no actual final consumption because most of the services provided by NPISHs are individual in nature and, for simplicity, all services provided by NPISHs are treated by convention as social transfers.

Additivity

Additivity is a property pertaining to a set of interdependent index numbers related by definition or by accounting constraints under which an aggregate is defined as the sum of its components; additivity requires this identity to be preserved when the values of both an aggregate and its components in some reference period are extrapolated over time using a set of volume index numbers.

Base period

The period that provides the weights for an index is described as the base period.

Basic price

The basic price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any tax payable, and plus any subsidy receivable, on that unit as a consequence of its production or sale; it excludes any transport charges invoiced separately by the producer.

C.i.f. price

The c.i.f. price (i.e. cost, insurance and freight price) is the price of a good delivered at the frontier of the importing country, including any insurance and freight charges incurred to that point, or the price of a service delivered to a resident, before the payment of any import duties or other taxes on imports or trade and transport margins within the country.

Capital transfers

Capital transfers are transactions in which the ownership of an asset (other than cash and inventories) is transferred from one institutional unit to another, in which cash is transferred to enable the recipient to acquire another asset or in which the funds realised by the disposal of another asset are transferred.

Chain indices

Chain indices are obtained by linking price (or volume) indices for consecutive periods by using weighting patterns appropriate to those periods.

Changes in inventories (including work-in-progress)

Changes in inventories (including work-in-progress) are measured by the value of the entries into inventories less the value of withdrawals and the value of any recurrent losses of goods held in inventories.

Compensation of employees

Compensation of employees is the total remuneration, in cash or in kind, payable by enterprises to employees in return for work done by the latter during the accounting period.

Constant prices

Constant prices are obtained by directly factoring changes over time in the values of flows of goods and services into two components reflecting changes in the prices of the goods and services concerned and changes in their volumes (i.e. changes in "constant price terms").

Consumption good or service

A consumption good or service is one that is used (without further transformation in production) by households, NPISHs or government units for the direct satisfaction of individual needs or wants or the collective needs of members of the community.

Consumption of fixed capital

Consumption of fixed capital represents the reduction in the value of the fixed assets used in production during the accounting period resulting from physical deterioration, normal obsolescence or normal accidental damage.

Current transfers

Current transfers consist of all transfers that are not transfers of capital; they directly affect the level of disposable income and should influence the consumption of goods or services.

Deductible VAT

Deductible VAT is the amount of VAT payable on purchases of goods or services intended for intermediate consumption, gross fixed capital formation or for resale which a producer is permitted to deduct from his own VAT liability to the government in respect of VAT invoiced to his customers.

Disposals

Disposals of assets (inventories, fixed assets or land or other non-produced assets) by institutional units occur when one of those units sells any of the assets to another institutional unit.

Export subsidies

Export subsidies consist of all subsidies on goods and services that become payable to resident producers when the goods leave the economic territory or when the services are delivered to non-resident units; they include direct subsidies on exports, losses of government trading enterprises in respect of trade with non-residents, and subsidies resulting from multiple exchange rates.

Export taxes

Export taxes are taxes on goods or services that become payable when the goods leave the economic territory or when the services are delivered to non-residents; they include export duties, profits of export monopolies and taxes resulting from multiple exchange rates.

Exports of goods

Exports of goods consist of exports of the following items from residents to non-residents, generally with a change of ownership being involved: general merchandise, goods for processing, goods procured in domestic ports by non-resident carriers, and non-monetary gold.

Exports of services

Exports of services consist of the following services provided by residents to non-residents: transportation; travel; communications; construction; insurance; financial; computer and information; royalties and licence fees; other business services; personal, cultural, and recreational services; and government services n.i.e.

F.o.b. price

The f.o.b. price (free on board price) is the c.i.f. price less the costs of transportation and insurance charges, between the customs frontier of the exporting (importing) country and that of the importing (exporting) country.

Factor cost

Gross value added at factor cost is not a concept used explicitly in the System but it can easily be derived by subtracting the value of any taxes, less subsidies, on production payable out of gross value added.

Final consumption

Final consumption consists of goods and services used up by individual households or the community to satisfy their individual or collective needs or wants.

Final consumption expenditure of government

Government final consumption expenditure consists of expenditure, including imputed expenditure, incurred by general government on both individual consumption goods and services and collective consumption services.

Final consumption expenditure of households

Household final consumption expenditure consists of the expenditure, including imputed expenditure, incurred by resident households on individual consumption goods and services, including those sold at prices that are not economically significant.

Final consumption expenditure of NPISHs

Final consumption expenditure of NPISHs consists of the expenditure, including imputed expenditure, incurred by resident NPISHs on individual consumption goods and services.

Financial intermediation services indirectly measured (FISIM)

Financial intermediation services indirectly measured (FISIM) is an indirect measure of the value of financial intermediation services provided but for which financial institutions do not charge explicitly.

Fixed assets

Fixed assets are tangible or intangible assets produced as outputs from processes of production that are themselves used repeatedly or continuously in other processes of production for more than one year.

Goods

Goods are physical objects for which a demand exists, over which ownership rights can be established and whose ownership can be transferred from one institutional unit to another by engaging in transactions on markets.

Gross

The term "gross" is a common means of referring to values before deducting consumption of fixed capital (generally used as in "gross capital stock" or "gross domestic product").

Gross capital formation

Gross capital formation is measured by the total value of the gross fixed capital formation, changes in inventories and acquisitions less disposals of valuables for a unit or sector.

Gross domestic product - expenditure based

Expenditure-based gross domestic product is total final expenditures at purchasers' prices (including the f.o.b. value of exports of goods and services), less the f.o.b. value of imports of goods and services.

Gross domestic product - income based

Income-based gross domestic product is compensation of employees, plus taxes less subsidies on production and imports, plus gross mixed income, plus gross operating surplus.

Gross domestic product - output based

Output-based gross domestic product is the sum of the gross values added of all resident producers at producers' prices, plus taxes less subsides on imports, plus all non-deductible VAT (or similar taxes).

Gross domestic product at market prices

Gross domestic product at market prices is the sum of the gross values added of all resident producers at producers' prices, plus taxes less subsides on imports, plus all non-deductible VAT (or similar taxes).

Gross fixed capital formation

Gross fixed capital formation is measured by the total value of a producer's acquisitions, less disposals, of fixed assets during the accounting period plus certain additions to the value of non-produced assets (such as subsoil assets or major improvements in the quantity, quality or productivity of land) realised by the productive activity of institutional units.

Gross national disposable income

Gross national disposable income may be derived from gross national income by adding all current transfers in cash or in kind receivable by resident institutional units from non-resident units and subtracting all current transfers in cash or in kind payable by resident institutional units to non-resident units.

Gross national income (GNI)

Gross national income (GNI) is GDP less net taxes on production and imports, less compensation of employees less property income payable to the rest of the world plus the corresponding items receivable from the rest of the world (in other words, GDP less primary incomes payable to non-resident units plus primary incomes receivable from non-resident units); an alternative approach to measuring GNI at market prices is as the aggregate value of the balances of gross primary incomes for all sectors; (note that gross national income is identical to gross national product (GNP) as previously used in national accounts generally).

Gross saving

Gross saving is gross disposable income less final consumption expenditure.

Gross value added

Gross value added is the value of output less the value of intermediate consumption; it is a measure of the contribution to GDP made by an individual producer, industry or sector.

Gross value added at basic prices

Gross value added at basic prices is output valued at basic prices less intermediate consumption valued at purchasers' prices.

Gross value added at producers' prices

Gross value added at producers' prices is output valued at producers' prices less intermediate consumption valued at purchasers' prices.

Import duties

Import duties consist of customs duties, or other import charges, which are payable on goods of a particular type when they enter the economic territory.

Import subsidies

Import subsidies consist of subsidies on goods and services that become payable to resident producers when the goods cross the frontier of the economic territory or when the services are delivered to resident institutional units.

Imports of goods

Imports of goods consist of imports of the following items from non-residents to residents, generally with a change of ownership being involved: general merchandise, goods for processing, goods procured in foreign ports by domestic carriers, and non-monetary gold.

Imports of services

Imports of services consist of the following services purchased by residents from non-residents: transportation; travel; communications; construction; insurance; financial; computer and information; royalties and licence fees; other business services; personal, cultural, and recreational services; and government services n.i.e.

Indirect taxes

As traditionally understood, indirect taxes are taxes that supposedly can be passed on, in whole or in part, to other institutional units by increasing the prices of the goods or services sold but the term "indirect taxes" is not used in 1993 SNA; rather, taxes are specifically identified by their purpose (e.g. taxes on products).

Intermediate consumption

Intermediate consumption consists of the value of the goods and services consumed as inputs by a process of production, excluding fixed assets whose consumption is recorded as consumption of fixed capital; the goods or services may be either transformed or used up by the production process.

Inventories

Inventories consist of stocks of outputs that are still held by the units that produced them prior to their being further processed, sold, delivered to other units or used in other ways and stocks of products acquired from other units that are intended to be used for intermediate consumption or for resale without further processing.

Invoiced VAT

Invoiced VAT is the VAT payable on the sales of a producer; it is shown separately on the invoice which the producer presents to the purchaser.

Market prices

Market prices for transactions are the amounts of money willing buyers pay to acquire something from willing sellers.

Mixed income

Mixed income is the surplus or deficit accruing from production by unincorporated enterprises owned by households; it implicitly contains an element of remuneration for work done by the owner, or other members of the household, that cannot be separately identified from the return to the owner as entrepreneur but it excludes the operating surplus coming from owner-occupied dwellings.

Net

The term "net" is a common means of referring to values after deducting consumption of fixed capital (generally used as in "net capital stock" or "net domestic product"); it should be noted, however, that the term "net" can be used in different contexts in the national accounts, such as "net income from abroad" which is the difference between two income flows.

Net income from abroad

The difference between the total values of the primary incomes receivable from, and payable to, non-residents is often described as net income from abroad.

Net lending

Net lending is the net amount a unit or a sector has available to finance, directly or indirectly, other units or other sectors; it is the balancing item in the capital account and is defined as: (Net saving plus capital transfers receivable minus capital transfers payable) minus (the value of acquisitions less disposals of non-financial assets, less consumption of fixed capital); negative net lending may also be described as "net borrowing".

Net national disposable income

Net national disposable income may be derived from net national income by adding all current transfers in cash or in kind receivable by resident institutional units from non-resident units and subtracting all current transfers in cash or in kind payable by resident institutional units to non-resident units.

Net national income

The aggregate value of the balances of net primary incomes summed over all sectors is described as net national income.

Net saving

Net saving is net disposable income less final consumption expenditure.

Net value added

Net value added is the value of output less the values of both intermediate consumption and consumption of fixed capital.

Non-deductible VAT

Non-deductible VAT is the VAT payable by a purchaser which is not deductible from his own VAT liability, if any.

Non-financial assets

Non-financial assets are entities, over which ownership rights are enforced by institutional units, individually or collectively, and from which economic benefits may be derived by their owners by holding them, or using them over a period of time, that consist of tangible assets, both produced and non-produced, and most intangible assets for which no corresponding liabilities are recorded.

Non-produced assets

Non-produced assets are non-financial assets that come into existence other than through processes of production.

Non-profit institutions serving households (NPISHs)

Non-profit institutions serving households (NPISHs) consist of NPIs which are not financed and controlled by government and which provide goods or services to households free or at prices that are not economically significant.

Non-resident

A unit is non-resident if its centre of economic interest is not in the domestic economic territory.

Operating surplus

The operating surplus measures the surplus or deficit accruing from production before taking account of any interest, rent or similar charges payable on financial or tangible non-produced assets borrowed or rented by the enterprise, or any interest, rent or similar receipts receivable on financial or tangible non-produced assets owned by the enterprise; (note: for unincorporated enterprises owned by households, this component is called "mixed income").

Other subsidies on production

Other subsidies on production consist of subsidies, except subsidies on products, which resident enterprises may receive as a consequence of engaging in production (eg, subsidies on payroll or workforce or subsidies to reduce pollution).

Other subsidies on products

Other subsidies on products consist of subsidies on goods or services produced as the outputs of resident enterprises that become payable as a result of the production, sale, transfer, leasing or delivery of those goods or services, or as a result of their use for own consumption or own capital formation; there are three broad categories: (1) subsidies on products used domestically, (2) losses of government trading organisations, and (3) subsidies to public corporations and quasi-corporations.

Output

Output consists of those goods or services that are produced within an establishment that become available for use outside that establishment, plus any goods and services produced for own final use.

Producer's price

The producer's price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any VAT, or similar deductible tax, invoiced to the purchaser; it excludes any transport charges invoiced separately by the producer.

Property income

Property income is the income receivable by the owner of a financial asset or a tangible non-produced asset in return for providing funds to or putting the tangible non-produced asset at the disposal of, another institutional unit; it consists of interest, the distributed income of corporations (i.e., dividends and withdrawals from income of quasi-corporations), reinvested earnings on direct foreign investment, property income attributed to insurance policy holders, and rent.

Purchaser's price

The purchaser's price is the amount paid by the purchaser, excluding any deductible VAT or similar deductible tax, in order to take delivery of a unit of a good or service at the time and place required by the purchaser; the purchaser's price of a good includes any transport charges paid separately by the purchaser to take delivery at the required time and place.

Resident

An institutional unit is resident in a country when it has a centre of economic interest in the economic territory of that country.

Services

Services are outputs produced to order and typically consist of changes in the conditions of the consuming units realised by the activities of producers at the demand of the consumers; by the time their production is completed they must have been provided to the consumers.

Stocks

Stocks are a position in, or holdings of, assets and liabilities at a point in time and the System records stocks in accounts, usually referred to as balance sheets, and tables at the beginning and end of the accounting period; stocks result from the accumulation of prior transactions and other flows, and they are changed by transactions and other flows in the period (note that stocks of goods are referred to as "inventories" in the System).

Subsidies

Subsidies are current unrequited payments that government units, including non-resident government units, make to enterprises on the basis of the levels of their production activities or the quantities or values of the goods or services which they produce, sell or import.

Taxes and duties on imports

Taxes and duties on imports, excluding VAT, consist of taxes on goods and services that become payable at the moment when the goods cross the national or customs frontiers of the economic territory or when the services are delivered by non-resident producers to resident institutional units.

Taxes on production and imports

Taxes on production consist of taxes payable on goods and services when they are produced, delivered, sold, transferred or otherwise disposed of by their producers plus other taxes on production, consisting mainly of taxes on the ownership or use of land, buildings or other assets used in production or on the labour employed, or compensation of employees paid.

Taxes on products

Taxes on products, excluding VAT, import and export taxes, consist of taxes on goods and services that become payable as a result of the production, sale, transfer, leasing or delivery of those goods or services, or as a result of their use for own consumption or own capital formation.

Transfer

A transfer is a transaction in which one institutional unit provides a good, service or asset to another unit without receiving from the latter any good, service or asset in return as counterpart.

Valuables

Valuables are produced assets that are not used primarily for production or consumption, that are expected to appreciate or at least not to decline in real value, that do not deteriorate over time under normal conditions and that are acquired and held primarily as stores of value.

Value added - gross

Gross value added is the value of output less the value of intermediate consumption; it is a measure of the contribution to GDP made by an individual producer, industry or sector.

Value added - net

Net value added is the value of output less the values of both intermediate consumption and consumption of fixed capital.

Value added tax (VAT)

A value added tax (VAT) is a tax on products collected in stages by enterprises; it is a wide-ranging tax usually designed to cover most or all goods and services but producers are obliged to pay to government only the difference between the VAT on their sales and the VAT on their purchases for intermediate consumption or capital formation, while VAT is not usually charged on sales to non-residents (i.e., exports).

Kyrgyzstan

Source

National accounts are compiled and disseminated by the National Statistical Committee of the Kyrgyz Republic.

Annual and quarterly national accounts of the Kyrgyz Republic are compiled and disseminated in annual and quarterly publications on the social and economic situation and the yearbook of the Kyrgyz Republic, "Kyrgyzstan in figures". Monthly estimates are posted on the internet at www.stat.kg. Additionally, revised quarterly data on GDP and annual national accounts are published in the annual survey of national accounts of the Kyrgyz Republic.

Data on GDP from the production approach and the expenditure approach are also posted on the website of the National Statistical Committee: www.stat.kg.

General

The system of national accounts used in the Kyrgyz Republic is based on the methodological framework of the 1993 System of National Accounts (1993 SNA). Since 1993, GDP estimates have been calculated using 1993 SNA indicators. Prior to 1993, the Kyrgyz Republic used the concept of National Economic Balance (NEB). Experts from the Organization for Economic Cooperation and Development (OECD) (1993-1997) and the resident statistical adviser from the International Monetary Fund (IMF) (1995-1998) helped with the introduction of the 1993 SNA.

From 1990 through 1999, economic activity was classified according to the All-Union Classification of Branches of the National Economy; as of 2000, the State Classification of Types of Economic Activity (GKED) was used. GKED is based on the Statistical Classification of Economic Activities in the European Community (NACE). Macroeconomic indicators are calculated for 15 types of economic activity. Data are also compiled on the intersectoral balance of production and consumption of goods and services (input-output tables). The concise version consists of a 34 x 34 matrix, while the expanded version covers 52 types of economic activity and 91 kinds of goods and services (usually produced every five years, based on sample surveys of enterprises, the most recent data being from 2003).

The Classification of Individual Consumption According to Purpose (COICOP), the Classification of the Functions of Government (COFOG), the State Statistical Classification of Products (goods and services) (GSKP), and the Standard International Trade Classification (SITC) are used to calculate GDP from the expenditure side.

The National Statistical Committee published its methodology for compiling national accounts in 2008 in a special publication on the national accounts of the Kyrgyz Republic for the period 2002-2006. When the Kyrgyz Republic subscribed to the Special Data Dissemination Standard (SDDS) of the International Monetary Fund (IMF), brief methodological notes were posted on the IMF website.

Preliminary monthly estimates of GDP are prepared using the production approach and disseminated by the National Statistical Committee two weeks after the end of the reporting period (year). Preliminary quarterly estimates of GDP are calculated using the production and consumption approaches 90 days after the end of the reporting period and are posted on the IMF website. The quarterly data are also calculated in average prices of the previous year and, using the production approach, also in average annual 2000 prices. The full set of indicators of the national accounts system is published in the annual compendium on the national accounts of the Kyrgyz Republic which is issued every year in the December following the reporting year. This publication contains revised indices for institutional sectors of the economy and types of economic activity, in current and comparable prices. It also contains revised quarterly GDP data based on production and final use.

The reporting period is the calendar year and there are consistent time series of data beginning in 1990. They

cover all economic activity carried out in the Kyrgyz Republic and include estimates of the underground economy.
The base year for the compilation of data in comparable prices is the previous year.
The base year for calculations of indices in constant prices is 2000.

Methodology:

Overview of GDP Compilation

In the Kyrgyz Republic GDP is calculated using three approaches: production, expenditure and income.
The main method of compiling GDP indicators is the production approach.

Production-based GDP is calculated at market prices as the sum of the gross value added generated by resident producers plus net taxes (excluding subsidies) on products. Using the expenditure approach, GDP is calculated as all final expenditure in purchasers' prices plus gross fixed capital formation and net exports of goods and services. Using the income method, GDP is calculated as the sum of employees' compensation, gross profit, gross mixed income and taxes less subsidies on production and imports.

GDP data are disseminated in current and comparable (previous year's) prices. Quarterly GDP is compiled and disseminated in current prices, previous year's prices and also constant 2000 prices, and covers the entire economy of the Kyrgyz Republic. The calculation is made in market prices. Estimates of the underground economy are added to GDP.

No seasonal adjustments are made to GDP data.

The data are compiled using the methodology set out in the 1993 System of National Accounts (1993 SNA) and classified according to GKED (NACE).

Disaggregated GDP data obtained using the production method are presented in both current and constant prices:
1. Gross value added disaggregated by type of economic activity (15 types of activity) at basic prices;
2. Financial intermediation services indirectly measured (FISIM) (calculated separately and not distributed by type of economic activity);
3. Taxes on products less subsidies on products (in accordance with the 2001 Government Finance Statistics Manual of IMF (GFSM 2001)).

Most transactions are recorded on an accrual basis, in accordance with the general principle of the 1993 SNA, with the exception of current expenditure and income of government agencies which are recorded on a cash basis.

Output is estimated in basic prices. Intermediate and final consumption are valued at market prices. Gross fixed capital accumulation is recorded in market prices.

Non-market production is estimated on the basis of current expenditure, adding information on changes (increase or reduction) in arrears in wages. Imports and exports of goods and services are estimated at unit prices (f.o.b.).

Indicators of GDP based on the production method and categories of expenditure are estimated at current and comparable prices of the previous year; using the income method, the categories are estimated only at current prices.

Expenditure Approach

The main sources of data are household budget surveys, trade and consumer market statistics, the state budget performance report, balance of payments data and investment statistics. The calculation of household expenditure on goods and services for final consumption is based on data on the volume of retail turnover and the provision of commercial services. The volumes of retail turnover and commercial services are calculated at actual prices,

including VAT, excise and tax on sales of goods and services. Volume indicators for retail sales of goods and services are adjusted for concealed sales volumes.

Expenditure of households on consumer goods is determined from retail turnover less purchases of goods by households and enterprises for intermediate consumption or accumulation.

Expenditure on commercial services is estimated as the total sum of the value of services acquired by households, less purchases of services used for intermediate consumption (living expenses when travelling on business, construction and repair services, and so on). The total sum of services acquired by households is calculated on the basis of reports from enterprises providing paid services to households, adjusted for non-reporting enterprises and services provided by individuals (the adjustment is made from data from household budget surveys).

The value of agricultural output for own consumption is determined on the basis of the balances of agricultural output in private household plots and farm holdings, calculated for each product in money and in kind.

Data on final consumption by government agencies are compiled on the basis of current expenditure of the State budget (GFSM 2001). The value of total expenditure on final consumption by government agencies is estimated on the basis of the production account for that sector.

Final consumption by government agencies is equivalent to the gross output of that sector, calculated from the production account (that is, it is transferred from the production account) deducting final consumption by government agencies which provide collective and individual services. Collective services include: agricultural services (including ploughing and chemical soil treatment), forestry and hunting, science and basic research, administration (with the addition of data on technical assistance from the balance of payments), defence and roads; individual services include: housing and public utilities, health care and sport, social security, education, culture and art. Non-recurring sales of goods and services are then subtracted from the amounts obtained, and the remaining amounts represent government expenditure on final consumption.

Expenditure on final consumption of non-profit institutions serving households (NPISH) consists of expenditure of those institutions on consumer goods and services provided to households free of charge or at prices that are not economically significant. The main sources of financing for their expenditure are members' contributions, donations and other transfers. NPISH expenditure on final consumption includes that of trade unions, foundations, associations, political parties, religious organizations and independent departments of enterprises and organizations.

Data on gross fixed capital formation is compiled from capital investments, calculated from the clients' side, geological prospecting, increase in the value of the main livestock herds and planted forests; expenditure on the creation and acquisition of software, acquisitions of originals of literary and artistic works and major repairs of fixed assets, and also expenditure on the purchase of equipment and instruments, non-expendable items and books for libraries, costs of ownership transfer of non produced assets; and changes in inventories of equipment not yet installed. Gross fixed capital formation also includes cost-free fixed capital flows; retired assets are deducted.

The increase in the value of livestock herds is determined from the balance of fixed assets taking the remaining value (adjusted for depreciation) as the difference between acquisitions and disposals.

Expenditure on the purchase of equipment and instruments, non-expendable items and books for libraries by State-financed organizations using budgetary resources is valued on the basis of the State budget performance report.

Data on cost-free capital flows are obtained from the balance of payments. Consumption of fixed capital is reflected in the balance of fixed assets (after a deduction for depreciation).

Changes in inventories of tangible current assets include changes in inventories of supplies and materials, finished

goods and work in process. Estimated changes in inventories of tangible current assets are based on statistical reports. In addition, changes in inventories of agricultural production in private household plots and farm holdings are calculated on the basis of the balances of agricultural products. When calculating changes in inventories at current prices, the reporting data are adjusted to exclude the influence of price changes over the reporting period. All inventories are converted to the average annual prices for the current year.

Data on the acquisition of valuables are compiled from data on the sale of jewellery to households. The net acquisition of valuables is equivalent to purchases of jewellery.

The volume of exports and imports of goods and services in current prices is determined on the basis of data from the balance of payments. Both exports and imports are expressed at f.o.b. prices. The balance-of-payments data are expressed in United States dollars; the value in soms can be obtained by multiplying the quarterly indicators by the average quarterly exchange rate of the som to the dollar, while the annual value is obtained from the sum of the quarterly figures. The GDP estimate based on the expenditure approach is at previous year's prices.

Consumer goods and services consumed by households are converted to the previous year's prices by deflation, using the consumer price index for the corresponding goods and services.

Agricultural output produced by households for their own final consumption is converted to the previous year's prices using the deflator index for agricultural output.

The value of housing services consumed by owner occupiers is converted to the previous year's prices using the deflator index for housing production (production account).

Goods and services obtained from agricultural enterprises as payment in kind for labour are converted to the previous year's prices using the agricultural output price index.

Final consumption by government agencies providing individual and collective goods and services are converted to the previous year's prices using the deflator indices established for the output of the corresponding types of economic activity in the production account.

The consumer price index deflation method is used to convert to the previous year's prices the value of goods and services purchased by government agencies for transfer to households (non-recurring sales).

Expenditure on final consumption by NPISH are converted to the previous year's prices using the deflator index obtained from the output of that sector in the production account.

Gross fixed capital formation, changes in inventories of tangible current assets and the net acquisition of valuables are deflated using the price index for fixed capital investment, the livestock price index and the corresponding producer and consumer price indices.

Exports and imports of goods and services are converted using the corresponding price indices.

Income Approach

The income-based GDP estimate reflects the payment of primary income by institutional units which participate directly in the production of goods and services.

A special feature of calculating GDP using the income method, rather than the production or expenditure methods, is that one of its components (gross profit and gross mixed income) represents a balancing item and is calculated by the balance method, that is, as the difference between GDP and other components (employee compensation and taxes on production and imports).

Information on income generation is collected from comprehensive statistical reports of enterprises, organizations

and institutions with all forms of ownership and the sample survey of household budgets and also from the results of surveys, questionnaires and expert estimates of the underground economy.

The main sources for estimating employee compensation are the reports of enterprises and organizations on labour and employment statistics and also, for State-financed institutions, the reports of the Ministry of Finance and the Social Fund. Social insurance contributions made by employers for the economy as a whole and by type of economic activity are valued on the basis of the report on labour and compensation and these data are adjusted on the basis of the report of the Social Fund.

Nominal social insurance contributions for the economy as a whole and by type of economic activity are valued as the amount of actual payments for social benefits by enterprises and organizations according to the data from the statistical reporting form for labour and compensation and also from credit and insurance institutions and the Social Fund.

The main source of data on taxes and subsidies on production and imports is the report of the Ministry of Finance on State budget performance.

Income-based GDP is calculated only on an annual basis and at current prices.

Production Approach

Using the production method, GDP is calculated in market prices. Its value is obtained by calculating the sum of the gross value added in each sector (in basic prices) plus net taxes (less subsidies) on products and imports. Gross value added is a production indicator defined as output less intermediate consumption for the corresponding type of activity (sector).

The primary data sources are:
(a) The annual and quarterly reports on income and expenditure of State and private enterprises, which includes all types of enterprises that are legal entities and all types of economic activity in the open sector of the economy;
(b) The integrated household and labour force survey and other surveys carried out by the National Statistical Committee;
(c) Employment and wage surveys;
(d) Banking statistics provided by the National Bank of the Kyrgyz Republic and commercial banks;
(e) The report on State budget performance prepared by the Ministry of Finance;
(f) Customs payments and tax reports provided by the tax and customs services, respectively.

Special sample surveys of farm holdings and private household plots are carried out by statistical agencies, and data from administrative sources (aiyl okmotu, or rural councils) are also used.

The output indicator is determined on the basis of sectoral statistical data (statistics on industry; agriculture; construction; commerce; transport and communications and so on) and business statistics, and the content is harmonized with the SNA production boundaries.

GDP estimates at previous year's prices are based on volume indicators calculated in previous year's prices. For individual types of economic activity, the extrapolation method using volume or employment indices is used. The deflation method includes commercial services (CPI components).

Quarterly data in average annual prices are obtained by deflation with the established quarterly price indicators for each type of economic activity. The base year is 2000, and the average value of the indicators for each quarter of the base year is taken; thus the quarterly data for 2000 are calculated in average 2000 prices. On the basis of average values of the base year and using the volume index, the chain-link method is used to calculate quarterly data for the period 2000-2007.

Overview of the Compilation of the Integrated Economic Accounts

In accordance with the concepts of the 1993 SNA, the data processed include the set of accounts for the economy as a whole, the five institutional sectors of the domestic economy and the rest of the world. Flows (transactions) between institutional units are recorded at the time when claims and obligations arise, are transformed or are cancelled, that is, on an accrual basis.

Indicators of flows between institutional units and stocks (assets) are estimated at current market prices as agreed by the participants.

Calculations of production, income generation, income use and capital transactions are performed directly for institutional sectors of the domestic economy. The "rest of the world" accounts are compiled on the basis of data from the balance of payments.

Net lending or net borrowing is calculated from the capital account only. There are no mutual adjustments with items of the financial account as the relevant expertise is not available in the Kyrgyz Republic.

The national accounts estimates include a full set of accounts for each of the five institutional sectors. All the indicators, from the production account to the capital account, are calculated for each sector of the economy (non-financial corporations, financial institutions, general government, NPISH and households). The "rest of the world" accounts are compiled separately.

Data for non-financial corporations are based on the annual reports on income and expenditure of State and private sector corporations.

Data on financial institutions are based on the annual statistical reports of commercial banks and the insurance industry.

Data on general government are based on the annual performance reports for the State budget and for extrabudgetary funds.

Data on households and NPISHs are based on the annual household budget surveys and other specialized surveys.
The "rest of the world" data are based on the balance of payments of the Kyrgyz Republic.

One of the main problems in the collection and compilation of FISIM is its allocation to intermediate consumption, final consumption by households, and exports.

Lao People's Democratic Republic

Source

Reply to the United Nations national accounts questionnaire from the National Statistical Center (or Department of Statistics, DOS) of Lao PDR. The National Statistical Center is a department under the Ministry of Planning and Investment, which is responsible for the collection and dissemination of statistics and operates as the coordinating agency for statistical activities in Lao PDR.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) for the data up to year 2005, so far as the existing data would permit. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

A new series based on the 1993 SNA guideline is prepared for compiling GDP for 2006 to current year. However, the result of this estimation and its publication are on the proceeding of being approved. Therefore, data is not provided with detail on the time series until it will be approved and its consistency is revised. The new series of GDP are compiled from 1997 to 2005 benchmark and using various surveys such as Annual Establishment Survey (from 2002 to 2006), Annual Household Survey (from 2003 to 2005) and Lao Consumption and Expenditure Survey (1997/98, 2002/03, 2007/08). Based on the time series benchmark from 2002 to 2005, forward estimation for the year 2006 and 2007 is done.

Its results indicate the fruitful coverage on economic activities such as trade and maintain real estate and business services; community, social and personal services, financial intermediation including financial intermediation services indirectly measured, private households with employed persons.

The results imply the consistency, coherence and balance of economy through the production accounts, goods and services accounts and generate income accounts. Moreover, GDP are aggregated by ISIC 3.1 for economic activity and by COICOP for expenditure approach.

Methodology:

Overview of GDP Compilation

The compilation system for calculating GDP by activity at current and constant prices can be described as follows: A benchmark estimate of gross value added for 1990 was prepared mostly on the basis of quantity of production or quantity indicators; prices for these products based on some studies in major cities and estimated value added to output ratios. The quantities of production in each year are multiplied by the 1990 price to derive output at 1990 prices. Value added to output ratios estimated for 1990 are used to derive value added at constant prices. Value added estimates at constant prices in each year are inflated (in most cases) using the overall CPI to derive value added at current prices. When value indicators are used (such as government capital expenditures for construction), the estimates are deflated by the CPI.

In principle, all transactions are recorded on an accrual basis. Agriculture production is recorded according to harvest basis. Basic data on government operation (administrative data), which are on a cash basis, are not adjusted on an accrual basis. Statistics on government operations are prepared on a fiscal year basis, and are converted to the calendar year basis. The compilation system relies heavily on data on quantities of production or quantity indicators.

Production Approach

For most industries, the estimates are prepared by major groups of products. However, no standard classification on activities, such as International Standards Industrial Classification of All Economic Activities (ISIC) is used at present.

Agriculture, fisheries, and forestry:
Crops: Data quantity of production, by districts, of crops, fruits, and vegetables are available from Ministry of Agriculture and Forestry (MAF). These data are compiled at the district level by district offices of the MAF on the basis of reports from Village Heads and observations by District Offices about crops in their area.
Livestock: The available data refer to stocks of animals, which are compiled by District Offices of the MAF based on reports from Village Veterinary Workers.
Forestry: Quantities of timbers and logs are obtained from MAF.

Mining and quarrying; manufacturing and electricity: Ministry of Industry and Handicrafts collects data quantity of production though its District Office from large, medium and small enterprises registered with data District Offices. All large enterprises and most medium – size enterprises usually report. However the response from small enterprise (employing less than 10 person) is very poor, particularly in areas where small enterprises are concentrated data collected quarterly on a cumulative basis. As the data are collected during the last month of each quarter, the reported data include planned rather than actual production for the last month of the reporting period. Also the data are the collected on a fiscal year basis.

Construction: No data exist on construction activity. Government capital expenditures are used as a proxy for measuring value added in construction.

Transport, communication, and postal services: The Ministry of Communication, Transport, Post and Construction (MCTPC) collects data on physical volumes related to freight and passenger transports, provincial offices of the MCTPC obtain data mostly from transport association.

Wholesale and retail trade: Agriculture production, manufacturing production, and imports are used as proxies for measuring the contribution of wholesale and retail trade.

Banking: The Bank of Lao P.D.R. collects and provides to the NSC data on incomes and expenditure of all banks.

Ownership of dwelling: A benchmark estimate prepared for 1990 is extrapolated on the basis if growth rates in construction.

Public administration: Data on wages and salaries from the government account from the basis for calculating value added.

Non-profit institutions: No data are available. Inflow of foreign transfers under technical assistance is used as a basis for estimating value added.

Hotel and Restaurant: Data from the balance of payment on receipts from travel service are used as one indicator for estimating value added.

Other service: The benchmark estimate for 1990 is extrapolated using developments in estimate value added for hotel and restaurant and non-profit institutions.

Data on prices: Only the consumer price index, which is used extensively in the national accounts compilation is available.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), as well as the European System of National and Regional Accounts (1995 ESA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Lebanon

Source

Reply to the United Nations national accounts questionnaire from the Administration Centrale de la Statistique, Conseil des ministres du plan, Beyrouth. The official estimates were published annually by the Administration Centrale de la Statistique in "Les Comptes Economiques". Estimates are published in the Lebanon's Economic Accounts 1997-2002 by the Ministry of Economy and Trade. Latest data are published in the Economic Accounts of Lebannon-2004, by the Economic Accounts Mission, Presidency of the Council of Ministers. Data included in the 200 series was received from the Bank du Liban as a reply to the 2008 National Accounts Questionnaire in January 2009.

General

The latest estimates have been compiled by the Economic Accounts Mission, Presidency of the Council of Ministers following the United Nations System of National Accounts 1993 (1993 SNA). In early 2002, the Lebanese Government assigned a special team in the Ministry of Economy and Trade the task of compiling the national accounts for year 1997 till 2002, requesting technical assistance from the French National Institute of Statistics and Economic Studies. This team completed its mission in July 2005. In December 2005, the prime minister extended the mission of the team to compile national accounts for the year 2003 till 2005 in the presidency of the council of ministers.

Year 1997 was chosen to be the base year because the data for the year 1997 are sufficiently complete to allow the compilation of the main accounts describing all aspects of the economic life of the country. Moreover, 1997 may be considered a "normal" year – in that economic activity returned to a normal volume after the period of major project launches to rebuild the infrastructure destroyed by the war, and had not yet felt the effects of the world recession that appeared in subsequent years – and thus can serve as a base year for the construction of economic accounts. Accordingly, four publications were issued: one for year 1997 issued in year 2003 and one for years 1997 till 2002 in year 2005 and one for year 2003 issued in year 2006 and the publication of year 2004 issued this year.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production and expenditure approach mainly composed of the goods and services account. Income approach was adopted with the production and expenditure approach in estimating year 1997 because data was available but afterwards income approach of GDP was mentioned briefly in all the publications that followed.

The economic accounts of Lebanon are in compliance with concepts and definitions of the international system of national accounts as revised in 1993. However at the present development stage of national statistics, it is not possible to establish all the accounts considered in the system. In particular, accounts of institutional units can be elaborated in a satisfactory way only for the central government and the financial institutions. Consequently, the economic accounts 1998-2002 are composed of the goods and services account and institutional units accounts limited to the central government and banks. Integrated accounts for the whole of the economy and the rest of the world were established in a simplified way.

Central government accounts are established according to the standard system of national accounts on the basis of the State closing accounts and Treasury transactions accounts. Additional tables explain the changeover from the budgetary accounts nomenclature to the standardized nomenclature of national accounts. Accounts of financial institutions (banks) are established on the basis of balance sheets and "profit and loss" accounts communicated by the Banque du Liban.

Expenditure Approach

On the basis of 1997 figures, the value of goods used as intermediate products is estimated during the following years thanks to indicators provided by intermediate goods imports and to indicators of such goods production. This estimate is modified thereafter when carrying out successive accounts balancing. The final consumption is estimated in the same manner as the intermediate consumption: use of indices provided by imports analysis and output indices of products for private use. Moreover, a first exogenous estimate of food consumption is made, based on an assumption of population growth by 1.3% per year and of price elasticity between -1.5 and 0 according to the product. Just as for the intermediate consumption, these first estimates are corrected when carrying out the accounts balancing.

Estimation of gross fixed capital formation for the years 1998-2002 is entirely based on the evolution of equipment goods imports intended for different production sectors and on construction and public works estimates. The breakdown of equipment goods between household use (recorded in final consumption) and professional use (recorded in gross fixed capital formation) contributes to a less arbitrary estimation.

Customs statistics give in principle the value of goods exports. However, customs declarations proved to be clearly underestimated. Significant corrections were made to 1997 statistical data. The same correction coefficients were applied to 1998-2002 series with some supplementary modifications introduced during the accounts balancing. Exports of services are estimated roughly on the basis of some indicators: accounts of the telecommunications Direction, flows of transit and re-exports.

Changes in inventories are not directly covered by statistics. This item was introduced to regularize some variations, which looked abnormal. In particular, the very strong peak of imports in 2001 after a period of fall and before a fall again in 2002 can only be explained by a change in inventories. The magnitude of this move results from the arbitration carried out during the accounts balancing. Except for rare exceptions, the agriculture Ministry agriculture provides output estimates according to the 1997 agricultural census and yearly agriculture surveys. The electricity output is estimated in volume by statistics on overall consumption in kWh and in value by applying a unit value index. Water output is estimated by analyzing evolutions of main water offices accounts. The output of other industrial goods is estimated mainly thanks to indices of raw material imports. For agro alimentary industry products, the local output of agricultural products intended for manufacturing was also taken account. The construction value was estimated using a composite index made up with data on local cement sales and raw material imports for construction.

The services output is estimated on the basis of the 1997 accounts by using various indicators: movements in ports and airport and oil consumption for transports; accounts of Post and telecommunications authorities for the communication sector; number of marriages for housing services; arrivals of tourists and population growth rate for the hotels and restaurants activity (and also the special sales tax on restaurants); school statistics for education; drugs imports and expenses of social security health department and of the health ministry the health services; data from banks and insurances for the financial services; State closing accounts for the non-market services.

Imports data are provided by customs statistics. Very few modifications were brought to these statistics since the Customs has a close control of importers declarations. The few modifications are as follows: Gold ingots and banknotes imports are excluded from goods and services accounts. Only a small proportion of gold used in jewellery-making was reintroduced thereafter. The ministry for energy and oil provided oil products imports data. Minor material errors were corrected when computing unit values. Taxes on imports include customs duties, excise duties and VAT since 2002. They are drawn from customs statistics.

Lesotho

Source

The preparation of national accounts statistics in Lesotho is undertaken by the Bureau of Statistics, Maseru. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The official estimates together with methodological notes on sources and methods are published in a series of reports entitled "National Accounts". Beginning 1980, the estimates have been revised utilizing new sources of information. The most important of which is the 1986/87 Household Budget Survey. The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations Systems of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

The Bureau of Statistics have revised and rebased the national accounts of Lesotho. The base year for estimates at constant prices has been updated to 2004; previously it was 1995. The methodology has been reviewed, and new sources have been used. This publication presents main tables for the years 1998-2007: gross domestic product (GDP) by activity; GDP by expenditure; and the derivation of main national accounting aggregates. Revised estimates of GDP by activity are available back to 1982 and are available at the website of the Bureau of Statistics in an Excel file for download. Besides, an experimental GDP by expenditure series prior to 1998 can be made available for specific purposes on request.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

All items of gross domestic product by expenditure type are estimated through the expenditure approach. Government final consumption expenditure, consisting of wages and salaries and purchases of goods and services, is obtained from government accounts. The government expenditure is classified by the type of service provided by the central authorities. Private consumption and gross fixed capital formation are now estimated within the framework of a supply and use table. It has not been possible to balance supply and use completely, hence the discrepancy in the tables on GDP by expenditure. The 2003 household budget survey has been important in this process. Increase in stocks is estimated mainly from questionnaires and surveys carried out for the agricultural sector. Gross fixed capital formation consists of the value of purchases and own-account construction of fixed assets by government, private and public enterprises, individuals and non-profit institutions. Various sources such as questionnaires and imports of building materials are used to collect the information. The gross capital formation in plant machinery and vehicles of the new series is assumed to be 1.2 times the imports of capital goods. Total exports and imports of goods and services have been aligned with the balance of payments, which has been reviewed recently. Estimates of exports and imports of merchandise are obtained from foreign trade statistics with adjustments made for differences in coverage and valuation. Exports are recorded f.o.b. at the border of Lesotho and imports are also recorded f.o.b. at the point of dispatch. The estimates of import and export at constant prices have been improved by using detailed South Africa production price indices as well some other data. For the

estimates of GDP at constant prices, household consumption is obtained as a residual. The estimates of gross capital formation and the imports and exports of goods and services are calculated by using the relevant import price indexes.

Income Approach

Wages and salaries are derived from the government accounts and other returns. Estimates of operating surplus are derived as residuals from the production accounts of all sectors. Depreciation is obtained from returned questionnaires and no estimate is available for the government or subsistence sectors. Indirect taxes consist mainly of revenue received by Lesotho as a member of the customs agreement with Botswana, South Africa and Swaziland. Subsidy figures consist of government contributions to defray part of the operating expenses of government and other enterprises.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate the value added of the different industries except for producers of government services in which case the income approach is used. The agricultural division of the Bureau of Statistics carries out regular annual surveys. The 1970 census of agriculture and the 1973 agricultural survey are used to derive estimates of cereal production, assuming a wastage of six per cent during the various stages of harvest. The 1967-69 rural household survey is used for fruit and vegetable production estimates. For livestock, balance sheets prepared by the agricultural division of the Bureau of Statistics provide changes in stock estimates, to which the average values for different types of livestock are applied. For the new series, the annual crop survey and annual livestock survey supply information on quantities produced. The price information for the crop is available from the Ministry of Agriculture while the price movement for livestock is deducted from retail price index. For meat production, average carcass weights are applied to the number of livestock slaughtered which are obtained from the Ministry of Health and annual production surveys.

Detailed income statements have been used for an improved estimated of mining for the years from 2004. The value of diamonds sold to licensed dealers by diggers is regarded as the value of diamonds exported from Lesotho. The receipts from diamonds are regarded as a contribution by the mining sector to GDP. Data on quantities and values of diamonds are obtained monthly from the Department of Mines and Geology. For manufacturing, data are derived from questionnaires prepared specially for manufacturing enterprises while data for handicrafts are based on the 1967-1969 rural household consumption and expenditure survey. For years 1980-1985, the estimates of manufacturing have been reconciled with the Yearbook of Industrial Statistics 1987. The estimates of the years after 1985 are based on industrial survey and survey of industrial production.

Data for electricity and water are obtained from the balance sheets of the electricity corporation and accounts of the concerned ministry. Special questionnaires filled in by building contractors are used for the construction sector. Estimates of own-account contribution are included. For the new series, value added of construction is a fixed proportion of the input of building material which is based on import statistics. For the trade sector, questionnaires are used for large enterprises while the results of a survey conducted in 1970-1971 are used for small enterprises. Estimates of the public transport and communication sector are based on government accounts supplemented by inquiries while estimates of private transport are obtained from the concerned enterprises.

For the financial sector, the output of the Central Bank is now calculated as the sum of costs including an estimated profit margin. The insurance industry is calculated on the basis of detailed financial statements, which were not previously available. Financial services indirectly measured (FISIM) has now been allocated to households and government. For ownership of dwellings, government accounts provide information for the public sector while questionnaires returned by businesses and institutions are used for the private sector. The 1972-73 urban household survey is used to estimate imputed rent. Information relating to general government services is obtained from the government accounts. Data on other services are obtained through questionnaires and special inquiries. The estimates of GDP by kind of economic activity at constant prices are calculated by using relevant price indexes for most of the industries.

The 2003 household budget survey has provided benchmark estimates for a number of small scale activities.

Previously, imputed import duties were recorded as taxes on products. This is not in line with international recommendations. The revised estimates include only the import duties actually collected by Lesotho on imports from outside the Southern African Customs Union (SACU).

Liberia

Source

The preparation of national accounts statistics in Liberia is undertaken by the Liberia Institute of Statistics and Geo-Information Services (LISGIS). The accounts are published annually in "Survey of Liberia". A description of the sources and methods used for the national accounts estimation is found in "Sources and Methods of Estimation of National Product, 1970-1973", along with the 1981-1986 series.

An up-date of the "New Series and Methodology for Estimating Gross Domestic Product, 1973" was published in 1975, 1978 and 1987 respectively.

General

The estimates are generally in accordance with the classifications and definitions recommended in the 1968 United Nations System of National Accounts (SNA). The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. The accounts are based on a calendar year (Jan.—Dec.). Given the level of support from the Government and other development partners, there is a plan to revise the estimates, after the conduct of an Establishment Census, where a survey frame for the conduct of National accounts survey will be based. The 1987 publication on sources & methods is the latest publication; data are obtained upon request from the Liberia Institute of Statistics. In order to revise the series of accounts, LISGIS will conduct an Establishment Census. The results of the exercise will provide an opportunity to draw up a sample frame for National Accounts annual survey, which is expected to be conducted in 2008.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the income approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks and exports and imports of goods and services. The commodity-flow approach is used to estimate private final consumption expenditure and gross fixed capital formation. The main sources used for estimating government final consumption expenditure are the monthly revenue and expenditure reports contained in "Government Accounts of Liberia". For private expenditure on imported goods, the c.i.f. value and import duties are obtained directly from the import statistics of consumer goods while the trade and transport margin is put at 35 per cent of the c.i.f. value. For local production, estimates are obtained from the production statistics of goods and services. Changes in stocks are estimated for iron-ore only. The sources used are the annual reports of the iron-ore companies and an analysis based on the difference between production and exports. The estimate is obtained by finding the difference between the quantities produced and the quantities exported and applying the average export prices.

Gross fixed capital formation is estimated as value of local production plus imports minus exports plus transport costs, trade mark-ups, duties paid, etc. For machinery and equipment, the estimates are based on foreign trade statistics. For construction, the estimates are prepared by analysing import and local production of construction materials, the data of which are obtained from import statistics and the survey of establishments. The estimates of imports and exports of goods and services are based on the foreign trade statistics. Figures on exports and imports are supplemented by estimates for non-factor services. Constant price series of government expenditure is estimated by using employment data to extrapolate the base-year figures. The base-year value for stocks of

iron-ore is extrapolated by using a volume indicator. For the remaining components of GDP by expenditure type, the current values are deflated by price indexes.

Income Approach

The estimates of compensation of employees, operating surplus and consumption of fixed capital are obtained from income tax files, replies to the national accounts questionnaires and from annual reports and financial accounts. The estimates of indirect taxes and subsidies are based on income tax returns for the main activities.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The income approach is used to estimate the value added of most industries. When data are available, the production and expenditure approaches are also used. For the agricultural sector, value added of rubber production is estimated from the financial accounts of the rubber concessions, the income tax statements of all rubber companies, and from information obtained from local rubber farmers. For other agricultural crops and fishing, value added is obtained from the income tax files. The value added of forestry is based on an input-output study of the industry, using the national accounts surveys. For the mining of iron-ore, value added is obtained directly from the financial accounts of the companies. Information on production components of manufacturing is obtained from income tax files, semi-annual questionnaires and other supplementary series. An extrapolation is made for non-reporting establishments. The value added of electricity, gas and water is obtained directly from the annual reports and accounts of concerned enterprises and their replies to the national accounts questionnaires.

Estimates of the construction sector are derived mainly by using the commodity-flow approach. Domestic production of commodities used in construction is estimated and adjusted for exports, imports and changes in stocks and supplementary data on transport costs, dealers' margins, etc. is added. The value of imported construction materials and production statistics of locally produced construction are obtained. Information on substantial development of land undertaken is supplied by the companies. A combination of the production approach and the income approach is used for the trade sector. The output is equal to the gross margin. The income tax data and the technique of extrapolation are used to arrive at value added. The extrapolation process involves separating the large establishments from the others, extrapolating the value added by the change registered by comparable establishments and finally identifying new establishments and treating them as an additional contributor to value added. The estimates of the transport sector are derived from various sources such as national accounts questionnaires, income tax files and reports of the motor vehicle division.

The gross output of the financial sector is equal to the sum of actual service charges and imputed service charges. The data required for the value added are obtained through a questionnaire. The estimates of real estate and ownership of dwellings are obtained by extrapolating the 1999/2000 LDHS (Liberia Demographic & Health survey) estimate by means of the population growth rate and the rent component of the consumer price index. For producers of government services, the main source is the detailed analysis of the government accounts. The value added of other private services are extrapolated by the change in compensation of employees, interest, depreciation and operating surplus obtained from the income tax files. For the constant price estimates, price deflation is used for manufacturing, construction and trade sectors. For the remaining sectors, value added is extrapolated by using volume indexes.

Libyan Arab Jamahiriya

Source

Reply to the United Nations national accounts questionnaire from the Central Statistical Office. The preparation of national accounts statistics in Libyan Arab Jamahiriya is undertaken by the Ministry of Planning, Tripoli.

General

The estimates shown in the following table have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Reply to the United Nations National Accounts Questionnaire from the Statistics Division of the Office of Economic Affairs - Principality of Liechtenstein.

General

The national accounts data shown in the tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (SNA 1993). Work on the Liechtenstein National Accounts began in 1997 for the year 1998. The Liechtenstein National Accounts combine the production approach and the income approach and show the results for the five sectors of the national economy. For conceptual reasons the sectors Households (S.14) and Non-profit institutions serving households (S.15) are combined. The official figures are published in the internet (www.avw.llv.li – Link "Statistik") in "Volkswirtschaftliche Gesamtrechnung Liechtensteins", as well as in the annual Statistical Yearbook and the booklet "Liechtenstein in Figures."

Lithuania

Source

Reply to the United Nations national accounts questionnaire from the Department of Statistics of Lithuania, Vilnius.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA).

Methodology:

Overview of GDP Compilation

National Accounts in Lithuania have been compiled since 1992 on the basis of the 1993 System of National Accounts (1993 SNA), as well as the European System of National and Regional Accounts (ESA 1995), which is broadly consistent as regards definitions, accounting rules and classifications. One of the main indicators in the System of National Accounts, Gross domestic product (GDP), is available annually since 1990 and quarterly since 1995.

Gross national income (GNI), disposable national income, saving and net borrowing are calculated applying the Balance of Payments data, which reflect transactions with the rest of the world. The calculation started from 1993 with the introduction of Balance of Payments in Lithuania. Aiming at presentation of indicators, which characterise regional development, calculation of Regional GDP started in 1998. Statistics Lithuania carried out a revision of the 1995-2001 data of the National accounts in 2003. The purpose of the revision was to implement more accurate calculation methods using new and upgraded current information resources. All recently available methods have been implemented and used to revise time series indicators. As a result, it is now easier to interpret economic change trends.

Revised national accounts data are harmonized with methodological regulations and classifications of the 1995 System of European National and Regional Accounts. A major revision was carried out in 2005-2006, when two important methodological requirements of European Accounts were introduced. The financial intermediation services indirectly measured (FISIM) are now allocated to use, and the chain-linking technique was introduced for measuring the growth of National Accounts aggregates. Lithuanian time series have been revised and methodologically consistent time series have been published since 1995.

Luxembourg

Source

Reply to the United Nations national accounts questionnaire from the Service Central de la Statistique et des Etudes Economiques, Ministere de L'Economie Nationale, Luxembourg. The official estimates and descriptions are published by the Service in "Cahiers Economiques", Serie B, Comptes Nationaux. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations Systems of National Accounts 1968 (1968 SNA) so far as the existing data would permit. The estimates prepared according to the 1968 SNA are provided in the former national currency Luxembourg franc. The newly submitted constant price data which are compiled according to the 1993 SNA are not additive.

On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of Luxembourg the currency name for the data before 1999 is "1999 LUF euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 40.3399 Luxembourg franc. - The name of the currency of the newly submitted data is "1999 LUF euro" for the data before 1999 and "euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for Luxembourg, like for example all old data following the 1968 SNA is still in "Luxembourg franc", although this is not specifically indicated in the tables.

Madagascar

Source

Reply to the United Nations national accounts questionnaire from the Institut National de la Statistique et de la Recherche Economique, Ministere des Finances et du Commerce, Tananarive.

General

The official estimates of Madagascar have been adjusted by the Institut National de la Statistique et de la Recherche Economique to conform to the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit.

Malawi

Source

The preparation of national accounts statistics in Malawi is undertaken by the National Statistical Office. The official estimates are published in a series of reports entitled "National Accounts Report".

General

In this 2008 questionnaire, a new series of national accounts covering the years 2002-2005 is presented, with data that follows the United Nations System of National Accounts 1993 (1993 SNA). National accounts for Malawi are compiled on an annual calendar year basis using supply and use tables (SUT) in current and previous year's prices. These tables record how supplies of different kinds of goods and services originate from domestic industries and imports and how those supplies are allocated between various intermediate or final uses, including exports. These tables involve the compilation of a set of integrated production and generation of income accounts for industries.

Preliminary estimates for the years following the latest SUT are compiled using the production approach. Indicators for output of the various activities are applied to value added from the SUT. In this questionnaire, 2006 and 2007 are preliminary based on the 2005 SUT.

The previous National Accounts for Malawi were compiled using the production approach, based on the 1968 System of National Accounts (1968 SNA). The National Accounts for the years up to 2005 were compiled in 1994 prices, with only GDP
converted to current price by an aggregated price index composed of consumer price indices and price indices from external trade.

Methodology:

Overview of GDP Compilation

The supply and use table utilizes all existing economic statistics and administrative data sources for Malawi in a systematic and standardized way for the national accounts compilation. The important data sources are Crop estimates, Annual Economic Surveys (AES), Government budgets and accounts, Tax data, External Trade statistics, Integrated Household Surveys and Consumer price indices.

Expenditure Approach

The main data source for household final consumption within the SUT framework is the Integrated Household Surveys and the product balancing (the commodity flow method).

Government consumption is calculated as output of government less fees.

Gross fixed capital formation estimates are based on AES and government accounts. During the product balancing process, the private investments are adjusted based on supply side information.

Changes in stocks are estimated using the commodity-flow method.

Imports and exports of general merchandise goods and services contained in national accounts are consistent with estimates in the Balance Of Payments. The primary source for goods is the foreign trade statistics prepared by the Foreign Trade section of the NSO on the basis of data on import and export declarations for goods as collected by Malawi Revenue Authority (MRA). For services imports, data are compiled monthly by the RBM based

on Exchange Control forms (E-form) that are completed for purchases of foreign currency from authorized dealers. Export estimates are based on business interviews with enterprises involved in foreign transactions.

Production Approach

Output and intermediate consumption of industries is obtained from various surveys and administrative data sources.

For agriculture, forestry and fishing the main data sources are the Crop estimates survey and the AES for large estates. Other data sources include the Tobacco Control Commission (TCC), Tea Association of Malawi (TAMA), Department of Fisheries and Department of Forestry.

Market producers which cover among others the following industries: mining and quarrying; manufacturing; electricity, gas and water; building and construction; distribution and trade; passenger and freight transport; banking and financial services;
and other services use AES as their main data source for large scale companies. For the medium and small scale businesses, the Medium Business Economic Survey (MBES) conducted in 1998 and the IHS 2 were used as benchmarks.

Output of public administration and defence is obtained from government accounts.

Malaysia

Source

Reply to the United Nations national accounts questionnaire from the Department of Statistics, Putrajaya. The official estimates are published in a series of reports entitled "Annual National Accounts Gross Domestic Product (GDP)" on year 2007.

General

Malaysia national accounts statistics has been rebased to a base year of 2000. Hence, this year's "Annual National Accounts Gross Domestic Product (GDP)" replaces the 1987 base year series which had been in used for the period of 1999 until 2007. Since 1970, estimates are available in both current and constant prices. The initial constant price series published was valued at 1970 prices, for the period of 1971 to 1983.

Subsequently, the valuation of the constant series was updated to 1978 prices; and this series is available from 1978 up to 1997. The series was again updated to 1987 prices; and this series is available from 1987 to 2006. As of 2007, national accounts statistics have been rebased to 2000 base year. The rebasing exercise of the production and expenditure account enable improvements in matters relating to the practice and compliance to the concepts and guidelines of the manual on the compilation of System of National Accounts 1993 (1993 SNA) which was released by the United Nations. Beside that, improvements on changes of methodology, data sources, revision on data, updates on classification and published detailed data have also been implemented.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through two national accounting transactions, the production approach and the expenditure approach.

Expenditure Approach

The expenditure approach, in combination with the commodity-flow approach, is used to estimate expenditure aggregates. Government final consumption expenditure is based on public accounts and financial records and statements of the government bodies. Benchmark estimates of private final consumption expenditure are derived from detailed commodity balancing for the final accounts year. Between final accounts years, estimates of private consumption expenditure have been made by allocating the available supply of consumer goods and services from import and local production to the various consumption component items. Gross fixed capital formation includes not only construction, machinery and equipment but also investment in plantation and smallholders' perennial crops. Exports and imports of goods and services are estimated from customs returns and balance of payments returns. In the process of compiling the constant price series, the Producer Price Index and the Consumer Price Index are used as deflators. For the producers of government services, an average price index of material inputs, as well as a weighted index for salary revisions, has been utilized.

Production Approach

The production approach is used to estimate the value added by kind of economic activity. A detailed commodity-flow approach has been adopted for the reference years 1971, 1973, 1978, 1983, 1987 and 2000 to derive value added by sector. For those years in between, national accounts estimates are compiled based extensively on volume indicators of production. The indicators are used to extrapolate base year value added by sector/sub-sectors. Current monthly/annual statistics for agricultural crops, manufacturing, mining and other service sectors form the basis for computation of the value added. For producers of government services, the value added is derived from preliminary estimates of the expenditure obtained from the Accountant General's Office.

Maldives

Source

Reply to the United Nations national accounts questionnaire from the National Accounts & Statistics Section, Department of National Planning, Ministry of Finance and Treasury.

General

The latest data shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA), based on the response to a conceptual questionnaire and/or other available information. Previously, the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

The national accounts data for Maldives was first compiled in the year 1997 based on the classification of the United Nations System of National Accounts, and with the technical assistance from the Asian Development Bank to improve the national accounts statistics of Maldives. The input and output is entitled "Maldives Supply and Use tables for the year 1997". Supply and use table for the year 1997 was compiled in accordance with the SNA93. The fiscal year is the Western calendar year.

Methodology:

Overview of GDP Compilation

GDP for Maldives is compiled using the expenditure and production approach. However the main approach is the expenditure approach. The GDP estimates have been prepared from the base year 1995. The base-line 1995 figures had been taken from the SUT for that year. With the passing of time, new information became available in various areas and the base-line GDP estimates have been adjusted accordingly.

[a] Excludes financial intermediation services indirectly measured (FISIM).

Mali

Source

Reply to the United Nations national accounts questionnaire from the Direction Nationale de la Statistique et de l'Informatique, Ministere du Plan, Bamako, Mali. Official estimates are published by the Direction Nationale annually in "Comptes Economiques du Mali". On 1 June 1984, Mali joined the French Community in Africa of which the legal tender is CFA francs. Two Mali francs is equivalent to one CFA franc.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Malta

Source

The National Accounts of the Maltese Islands are compiled and published by the National Accounts Unit within the Economic Statistics Division of the National Statistics Office (NSO). The NSO is the executive arm of the Malta Statistics Authority, which was set up by Act XXIV of 2000 and came into force in March 2001. National Accounts data are published in detailed quarterly news releases ten weeks after the end of the quarter under review. These news releases and all the data are available online on the NSO's official website: www.nso.gov.mt. In addition to the quarterly news releases, the National Accounts Unit also publishes, from time to time, documents explaining the revisions carried out in the data.

General

Malta adopted the European System of National and Regional Accounts (ESA95), which is fully compatible with the System of National Accounts (SNA93). This process started when Malta re-applied to join the European Union in September 1998. At the same time, the old system was phased out and was discontinued in the first half of 2004. Data based on the ESA95 methodology is now available annually from 1995 onwards and quarterly from 2000 onwards. Constant price estimates are available from 2000 onwards. The base year is a moving one, with the chained Laspeyres method being used; however the reference year is 2000.

A full description of the sources and methods used for the compilation of the Gross National Income is available in a publication entitled Gross National Income Inventory (ESA95), a 355-page document which is available upon request. As from 1st January 2008, Malta joined the Euro Area and adopted the Euro as its official currency, replacing the Maltese Lira (Lm). In May 2005, the exchange rate was fixed with 1 Euro being equivalent to Lm0.4293. Figures in National Accounts news releases for 2004 onwards are being published in both currencies from this year, whilst from June 2008 onwards data will only be published in euros.

Methodology:

Overview of GDP Compilation

The three approaches to GDP are all shown in the quarterly news releases. The GDP level is benchmarked with the Production Approach, whilst the Expenditure Approach is used for deflating the GDP. The Production measure is the sum of value added for the Maltese economy plus taxes less subsidies on products. For market producers, value added is derived as the difference between gross output and intermediate consumption. On the other hand, value added for non-market producers is calculated as the sum of compensation of employees, other taxes less subsidies on production and consumption of fixed capital.

GDP from the Expenditure approach is the sum of final consumption for households, general government and non-profit institutions serving households (NPISH), gross fixed capital formation, valuables, changes in inventories and exports less imports. This approach is worked independently from the Production Approach and the resulting statistical discrepancy in the GDP level is allocated to 'changes in inventories'.

The Income measure is made up of the different uses to which value added is put. It consists of compensation of employees, other taxes less subsidies on production, gross operating surplus and mixed income. To obtain GDP at market prices, taxes less subsidies on products are also added, as for the production approach. The variables for this approach are derived from the other two approaches.

Expenditure Approach

The Expenditure Approach measures total expenditure on final goods and services produced in the domestic territory, or, alternatively, the sum of final uses of goods and services by resident institutional units plus exports less imports of goods and services. Final consumption expenditure by households consists of three broad

categories: locally produced consumer goods, imported consumer goods, and services to consumers. Household final consumption expenditure in the domestic market consists of expenditure in Malta by residents and non-residents. Expenditure abroad by residents is added while expenditure by tourists in Malta is deducted to arrive at the total final consumption expenditure estimate. The commodity flow method is used extensively for imported and locally manufactured goods while services are covered by extensive enquiries and use of existing data.

Non-profit institutions serving households' (NPISH) final consumption expenditure has been calculated for the first time in 1995 and classified using the COPNI classification. An exhaustive list of the units falling under this sector is available from the Business Register, and data are derived from financial accounts and other data sources such as surveys. Detailed statements of the government's recurrent expenditure are obtained on a quarterly basis from the Treasury Department and classified in line with SNA93. Extra-budgetary units are surveyed quarterly too. Detailed information on local councils' expenditure is available from the quarterly accounts, which are mandatory. Government recurrent expenditure is classified by COFOG.

Gross fixed capital formation consists of two broad categories: machinery (including transport equipment and other fixtures) and construction (including transfer payments on land and buildings). Data on imported goods that constitute capital formation are available from the International Trade Statistics Unit. Locally produced capital goods and installation costs are derived from the monthly survey of the manufacturing industry. Own or subcontracted installation costs incurred by government are derived from quarterly surveys. Inventories are broken down into four: materials and supplies, work-in-progress, finished goods and goods for resale. Data is derived from a quarterly stock survey, which is carried out by NSO. This item includes a statistical discrepancy, which is the difference between the GDP level estimated using the Production Approach and the aggregates from the Expenditure Approach. Therefore changes in this item do not necessarily imply movements in inventories.

Exports and income received from abroad are derived from the credit side of the Balance of Payments, and include exports of merchandise including ship repairing, freight, transshipment activities within the Malta Freeport, port services such as stores, bunker oil, fuel and port dues, registration fees, passenger service charges, route air navigation charges, air and sea fares, non-residents expenditure in Malta, income of residents from investments abroad, non-residents' reinvested earnings and diplomatic expenditure in Malta. Imports and income paid abroad are derived from the debit side of the Balance of Payments and include imported merchandise, freight and insurance, air and sea passenger fares, port services such as stores, bunker oil, fuel and port dues, expenditure by residents abroad, non-residents' income from investments in Malta and diplomatic expenditure.

Income Approach

The Income Approach adds all income earned by resident individuals or corporations in the production of goods and services and is therefore the sum of uses in the generation of income account for the total economy. This approach does not provide an independent estimate of GDP, since operating surplus is derived as a residual. Taxes on production and imports are levied by general government relating to the production and import of goods and services, the employment of labor, the ownership or use of land, buildings or other assets used in production. Subsidies are current unrequited payments that the Maltese government makes to resident producers. These are subsidies given independent of the quantity or value of the goods and services produced or sold.

Gross operating surplus represents the income which the units obtain from their own use of their production facilities, in other words value added less compensation of employees less taxes on production payable plus subsidies receivable. For non-market production, gross operating surplus is equal to the consumption of fixed capital. Mixed income is the term used for the generation of income by unincorporated enterprises (sole traders) owned by members of households and in which the owner also works without receiving a wage or salary.

Production Approach

The basic elements of the Production Approach are output and intermediate consumption, with value added as the balancing item, recorded in the production account of the system. In Malta, the production approach is the main approach to estimate GDP. Both production and intermediate consumption are shown in monetary terms. For

production basic prices are used whilst for intermediate consumption market prices are shown.

The production boundary is defined as any activity carried out by an institutional unit that uses inputs of material, labour and capital to produce output of goods and services. Purely natural processes of production are excluded. The production boundary includes production of individual and collective services by government, own-account production of housing services by owner-occupiers, and production of goods for own final consumption. It includes the production of services by paid domestic staff, and in principle production forbidden by law, and production from which the revenues are not declared to the fiscal authorities. Theoretically, products used for intermediate consumption are recorded and valued at the time they enter the process of production. They are valued at purchasers' prices. In practice, however, purchases intended to be used as inputs and the changes in the amounts of such goods held in inventory are recorded. To arrive at intermediate consumption, changes in inventories of inputs are subtracted from purchases. Value Added is a balancing item: output less intermediate consumption.

Reply to the United Nations national accounts questionnaire from the Economic Policy, Planning and Statistics Office (EPPSO), Majuro, Marshall Islands.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Mauritius

Source

The preparation of national accounts statistics in Mauritius is undertaken by the Central Statistics Office (CSO), Port Louis. The official estimates are published annually in "National Accounts of Mauritius". The estimates are also published in Economic and Social Indicators on a quarterly basis. All publications of the CSO can be downloaded from the office website (http://statsmauritius.gov.mu). Concepts and definitions, sources of data and methods of estimation appear in the "National Accounts of Mauritius" publication.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the 1993 System of the National Accounts (1993 SNA). In fact, Mauritius started the compilation of National accounts based on the 1993 SNA in April 2001. Previous estimates were according to the 1968 SNA. For comparability purposes, historical series as from 1976 have been worked out. These series are available on the CSO website.

In addition to the change in the system of the National Accounts, the office has also adopted the latest revision of industrial classification, that is, the International Standard Industrial Classification of Economic Activities ISIC, Revision 3 of 1990, for the classification of economic activities. As from April 2001 economic activities are classified according to a National Standard Industrial Classification (NSIC), which is an adapted version of ISIC Revision 3. This change in classification affected the value added of some industry groups but did not affect the overall Gross Domestic Product (GDP).

Methodology:

Overview of GDP Compilation

Gross Domestic Product is estimated mainly through the production approach. Expenditure and income approach GDP are also compiled. Input-Output tables are currently not compiled annually, but at a lower frequency based on the results of the Census of Economic Activities (CEA) conducted every five years.

Expenditure Approach

The latest sources of data for private expenditure on goods include the 2000 Census of Population, the 2001/02 Household Budget Survey (HBS), annual Continuous Multipurpose Household Surveys (CMPHS), annual trade reports and local production statistics. Figures of imported goods are extracted and reclassified from the foreign trade statistics and added to the figures for local production, both valued at market prices. Expenditure on services and private expenditure abroad are estimated on the basis of data from the HBS and balance of payments.

Government consumption expenditure is estimated on the basis of data from the annual financial reports of the central, regional and local governments. Actual data for central government are also obtained on a quarterly basis from the Treasury Department.

Information of investment on new residential buildings is mainly obtained from records of building permits issued by local authorities. Surveys conducted among parastatal bodies and private companies are the main source of data for non-residential buildings and other construction works. For machinery and equipment, imports of capital goods at c.i.f value are obtained from the annual trade reports. These c.i.f values are then evaluated at purchasers' prices by adding taxes on imports, landing cost, transportation cost, wholesale and retail margins and installation cost, if any. Domestic production figures are obtained from the annual returns of manufacturing firms.

Estimates of exports and imports of goods and services are based on sources such as the annual trade reports, monthly returns from banks and balance of payments figures. It is to be noted that exports and imports of services

are worked out by the Bank of Mauritius.

Current price estimates of the different components of GDP from the expenditure side are deflated by appropriate indices to obtain growth rates. It should be noted that increase in inventories include any discrepancy between the production and expenditure approach.

Income Approach

In order to compute value added through the income approach, information on compensation of employees for large establishments is obtained through annual surveys and for small establishments the CEA results are used.

For the sugar sector, detailed figures of payments in cash and in kind are supplied by all sugar estates with factories and for sugarcane planters (other than sugar estates) figures from employment records, statutory wage rates and the quantity of canes produced are used.

Wages and salaries for the public sector are obtained from the annual financial reports of the central, regional and local governments. Operating surplus is estimated from annual survey data for large establishments while estimates for small establishments are based on the results of the CEA.

No attempt has been made to estimate the consumption of fixed capital because of the lack of data on capital stock. Consequently all aggregates are given on a gross basis.

Data on taxes on production and imports are obtained from the annual financial reports of the central and local governments. Actual quarterly data for central government are also available from the Treasury Department.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at basic prices. The production approach is used to estimate value added of most industries. The expenditure approach is used for some private services and for public administration and defence.

For the agricultural sector, estimates are made on an item-by-item basis using annual statistical returns, annual surveys and reports supplemented by direct inquiries among producers and distributors. Sources used for sugar production are reports of the Chamber of Agriculture and financial statements of the Mauritius Sugar Syndicate.

The estimates for mining and quarrying refer to salt production, sand and stone quarries and are based on information collected through special enquiries.

The estimates for manufacturing are obtained through similar methods as those used for the agricultural sector. For sugar and related products, data are obtained from returns furnished by the factories and distilleries, reports and statistics of the Chamber of Agriculture and financial statements of the Mauritius Sugar Syndicate.

The estimates of electricity and water are based on information provided by the concerned enterprises and the financial reports of the government.

Information on private construction is obtained from records of building permits issued by municipal and district councils. Information furnished by building contractors and financial reports of the government are used for public construction.

For trade, information is obtained from the Mauritius Revenue Authority and from imports and local production statistics.

The main sources of data for hotels and restaurants are: Bank of Mauritius for tourism receipts, CEA for benchmarking purposes, HBS for information on Mauritian expenditure and Passport and Immigration Office for tourist arrivals.

For transport, storage and communications, data are obtained from an annual survey of establishments of this sector.

For the financial sector, the sources of information are mainly the questionnaires sent to banks (including Central Bank), insurance companies and other financial institutions. Figures available from their annual reports are also used.

The estimates for ownership of dwellings are based on the 2000 Housing Census and records of building permits issued.

For public administration and defence, detailed information is available from the annual financial report of the central government and local authorities. Actual data for central government are also obtained on a quarterly basis from the Treasury Department. For the private services, information is obtained from questionnaires sent to large establishments. Growth rates are derived by deflating current values by appropriate price indexes.

For the constant price estimates, double deflation is used. As this method requires extensive data on both inputs and outputs which in practice are very difficult to obtain, other methods using "proxy indicators" are used to indicate volume changes. The proxy indicators most often used are: (i) Physical quantities of goods produced, (ii) Physical quantities of materials used, (iii) Employment.

As most industries produce a large number of heterogeneous products, it is not possible to obtain separate physical output or input series. The value series are most often deflated by an appropriate price index to obtain the growth rates. The indices normally are: (i) Producer Price Index (PPI), (ii) Consumer Price Index (CPI), (iii) Construction Price Index, (iv) Wage/Salary Index and (v) Import/Export Price Index.

The preparation of National Accounts Statistics in Mexico is undertaken by the General Director of National Accounts Economic Statistics of the National Institute of Statistics, Geography and Information (Instituto Nacional de Estadística, Geografía e Informática), México. Official estimates are published by National Institute annually in "System of National Accounts of Mexico". Reply to the United Nations national accounts questionnaire was received through the Organization for Economic Co-operation and Development (OECD), Paris, France.

General

The estimates in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks, and exports and imports of goods and services. The estimates of gross fixed capital formation are largely based on the commodity-flow approach, such as private final consumption expenditure. The estimates of government consumption expenditure are based on government accounts.

For the private consumption expenditure and the gross fixed capital formation the values from 1993 are extrapolated by value indexes for each of the principal components. The indexes are constructed by using special quantity and price indexes. Exports and imports of goods are estimated from the tables of external transactions, which is based on the balance of payments. For the calculation of constant prices, general government expenditure in goods and services is deflated by a specially constructed price index and the value added is extrapolated by occupation index. The private consumption expenditure in constant prices is extrapolated with a quantity index. Gross domestic investment is also extrapolated by quantity index by kind of asset. Imports of goods and services are deflated by specially constructed price indexes and exports are extrapolated with quantity index.

Income Approach

The estimates of compensation of employees for general government, petroleum and electricity production, financial institutions and partly for the transport and communications sectors are based on direct current information on wages, salaries, etc. In the case of manufacturing, mining and private services the estimates are based on surveys that include wages and salaries. For construction, trade and agriculture, employment is extrapolated by production indexes and indexes of average wages. The estimates of consumption of fixed capital, are based on an approximation to the perpetual inventory methods. Each year depreciation of the capital stock, valued at replacement cost, is estimated, based on assumptions regarding the economic life replacement cost, based on assumptions regarding the economic life of the fixed assets. Government accounts are used in the estimation of indirect taxes and subsidies. Operating surplus is estimated as a residual.

Production Approach

The table of value added by kind of economic activity is prepared at basic prices, and the gross domestic product at market prices. The production approach is used to estimate value added of all industries with 1993 base year. The income approach or the expenditure approach is used for some sectors. The estimation of gross output, intermediate consumption and value added is 1993 base year from which extrapolations are made by means of value indexes. These value indexes are, in general, the products of price indexes and volume indexes. The volume index for agricultural production is based on statistics of gross output of more than 196 commodities. The index for livestock production is based on statistics of animals slaughtered for domestic consumption and export; live animals exported and inventory changes. The intermediate consumption of agricultural and livestock production is calculated updating the value of the principal components and commodities used (1993). For petroleum and other mining, the volume indexes are based on data from enterprises and a survey. The intermediate consumption is calculated updating the value of the principal components and commodities used, based on various surveys (1993). The volume index for manufacturing, which covers 250 activities, is based on data from the special survey and through direct inquiries to industry associations and manufacturers. Input is extrapolated by value indicators. The index for construction is compiled on the basis of the apparent consumption of some construction material. Fixed input-output coefficients are used (1993). The volume index for trade is based on estimates of trade margins on locally produced and imported goods. Gross margins are based on data from the commercial censuses and special surveys. Input is extrapolated by a weighed value index. The volume index for transport and communications is based on data from the concerned authorities and companies. Value added of financial institutions and insurance is estimated through the income approach. The real estate output is extrapolated by value index for housing construction and industrial rents. Fixed input-output coefficients are used at constant prices. Current prices are obtained through the use of a specially constructed price index of principal commodities and a quantity index. The population censuses and household budget surveys are used to impute the rents of owner-occupied dwellings. The public administration and defense is extrapolated by an index of occupation of the government employees. The input of the base year is extrapolated by quantity indexes in all sectors except for the electricity, construction, restaurants and hotels, financing and services sectors, in which cases either deflation by price indexes is done or constant input-output coefficients are assumed. In the community, social and personal services sector, various approaches are used to estimate output in constant prices, such as double deflation, extrapolation of value added and deflation by price indexes.

[a] Refers to Net Operating Surplus plus total Consumption of Fixed Capital of the sector.
[b] Refers to Net Mixed Income.

Micronesia, Federated States of

Source

The Office of Statistics, Budget & Economic Management, Overseas Development Assistance & Compact Management in Palikir, Micronesia is responsible for maintaining the national accounts statistics for the Federated States of Micronesia (FSM). The national accounts statistics were compiled by an external consultant under a grant provided by the United States Department of Interior, Office of Insular Affairs.

The official estimates of the 2006 national accounts statistics were published by the United States Department of Agriculture (USDA) Graduate School. The FSM Compact Economic Report – FY 2006 was provided to the United Nations by the Office of Statistics, Budget & Economic Management, Overseas Development Assistance & Compact Management. The following tables have been prepared by the United Nations National Accounts section using the aforementioned publication.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA), so far as the existing data would permit.

National accounts statistics are compiled during the Federated States of Micronesia fiscal year, which begins on October 1st and ends on September 30th. GDP is estimated using the income approach. Annual national account income statistics are estimated based on available data.

Monaco

Source

The Department of Finance and the Economy of the Principality set up a working group, led by the Office of the Director for Economic Growth, to survey the territory and list the economic agents and the statistical factors necessary to the compilation of financial aggregates. In that connection, certain factors that contribute to the compilation of GDP made it necessary to conduct a national statistical survey.

General

The European System of National and Regional Accounts (ESA 95), which came into effect in 1999 and is, for the most part, consistent with the United Nations System of National Accounts (1993 SNA), establishes a framework that ensures the consistency of evaluations within the European Union.

In order to ensure comparability and transparency in its relations with the international community, and as far as the available information allows, the Principality used ESA 95 in developing tools for measuring national wealth: gross domestic product (GDP) and gross national income (GNI).

Methodology:

Overview of GDP Compilation

The Principality used the GDP approach as an indicator of income to the extent that this approach does not mean the immediate implementation of national accounts. The major accounting balances show the macroeconomic consistency of this decision.

The GDP calculated in that fashion is expressed in "value": in other words, in current euros.

To assess the "real" growth of aggregates, the effect of price variation should be isolated from the "volume" effect. In order to do that, the "value" GDP is deflated by the average price variation observed over the past year. The result is the "volume" GDP.

The price index is currently estimated on the basis of changes in the French price index. Volume GDP will be calculated according to the change in the consumer price index, taking as the point of reference for the change in volume:
– The year 2005, as the base year for calculation of the Principality's economic aggregates since that was the first year in which the calculations were made; and
– The year 2000, which is the reference year for all countries and will facilitate easier comparative analysis.

Income Approach

The overall gross operating surplus was obtained by extrapolation, using the same methodology for the three years. It was possible to include some data on the corporations that did not respond, especially with regard to their legal form, their sector and subsector of activity and, in some cases, their workforce. For the 2007 GDP, and for the 2006 and 2005 GDP calculations, the data for the gross operating surplus of Monaco's economic agents were obtained through a survey.

First, the discriminant variables in gross operating surplus were determined on the basis of the information submitted by the responding corporations. Statistical analysis established five discriminant variables:

1. The size of the enterprise: the 100 largest enterprises were handled separately so that their atypical nature would not skew the extrapolation to non-responding corporations;
2. The legal form;
3. The sector of activity;
4. The corporation's workforce; and
5. The payroll.

However, the information available for the non-responding corporations did not allow us to use all these explanatory variables. For example, statistical analysis shows that the number of employees seems to be a discriminating variable for gross operating surplus. But that information could not be used because the number of employees was rarely available for the non-responding corporations. As a result, work was refocused on the known variables for those corporations: legal form and sector and subsector of activity.

Second, the results of the discriminant analyses were corrected for the bias introduced by atypical values. For one legal form and one subsector of activity, 90 per cent of the data were kept for extrapolation. The goal was to have a more stable estimate of gross operating surplus, that was not skewed by enterprises atypical for a given class. Extrapolation could proceed once the average estimates of gross operating surplus for each class was corrected using the information available for non-responding corporations.

Production Approach

Through the analyses carried out to date by most of Monaco's administrative authorities, 16 economic sectors of activity in the Principality have been identified.

Structural assumptions for the calculation of the gross domestic product by sector:

For wages, the Statistics and Economic Studies Division relied on the aggregates reported by social security administrations and the Association for Employment in Industry and Trade for each of the sectors identified.

The gross operating surplus for each was extrapolated using the same method as for the overall GDP calculation (c.f. supra).

Subsidies were allocated and weighted for each of the sectors, according to their type and application.

Several analyses of the distribution of taxes by sector were conducted and, on that basis, the following rules for their breakdown were set out:

A small portion of the value added tax collected is comprised of a "miscellaneous" account and a "not broken down by sector" account. It was agreed that for those two items a proportionality factor corresponding to the known fraction, by sector, of the value added tax collected could be used.

It was also agreed that this proportionality factor could be used for all the other items listed below:
- Transfers by France to the shared value added tax account;
- Import duties;
- Annual ship naturalization fees;
- Excise tax on petroleum products and tobacco excise duties;
- Profits from the tobacco monopoly;
- Leasing fees;
- Stamp duties;
- Taxes on insurance contracts;
- Alcohol excise duty; and
- Taxes levied on company vehicles.

However, it was agreed to include the "real estate value added tax" and "real estate transaction taxes" budget

items in the real estate sector.

GDP in current and constant euros:

In order to compile the GDP in constant euros, a revaluation or inflation index was applied to the 2007 aggregates. Taking the characteristics and geographic situation of the Principality's territory into account, it was decided to rely on the data and assumptions used to compile the GDP of France, published by its National Institute of Statistics and Economic Studies.

Annual accounts at constant prices (also called "volume") with base year 2000 are presented "in prices for the preceding year, chained, base year 2000".

The goal of this presentation is to give users of the aggregates the best time series at constant prices. Changes in aggregates at constant prices are more easily interpreted when the year of the constant prices is relatively close to the year of the prices under review.

For this reason, changes in aggregates at constant prices in annual national accounts for a given year are systematically calculated by taking the current price aggregates for the previous year as a base and applying to them the price changes of the previous year. These series are first set at 100 in 2000 and then multiplied by the current price value of the aggregate in 2000, simultaneously giving users the scale of the aggregate.

The base year for the aggregate is 2005. It is compiled in "value" — in other words, in current euros — and is calculated "per capita". In light of the specificities of the territory of Monaco, the population used in the calculation includes both the resident and the "presently employed" population.

Mongolia

Source

Reply to the United Nations national accounts questionnaire from the National Statistical Office of Mongolia. The official estimates and descriptions are published annually in "Mongolian Statistical Yearbook".

General

The estimates in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA) so far as the existing data would permit. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Montenegro

Source

The statistical offices of Montenegro are responsible for the compilation of official national accounts, according to Statistical Law of Montenegro. Results of this work have been issued in several publications since 2005, and in Releases for GDP.

List of publications for dissemination official national accounts are: A picture of Montenegrin economy provided by national accounts and Estimation imputed rent in Montenegro (2003-2005). All this publications are available online, on the web site of Statistical office of Montenegro (www.monstat.cg.yu).

General

The methodology used is harmonized with the System of National Accounts (SNA'93) and European system of accounts (ESA'95).

Gross domestic product (GDP) measures the total value of the goods and services produced by resident institutional units.

The GDP calculation includes all activities within the production frame defined by SNA'93 and ESA'95 and covers the whole territory of Montenegro.

The estimate of non-observed economy is partially included in calculation of GDP. Activities for which is estimated non-observed economy are: agriculture, tourism, constructing and education. The estimation for activities of agriculture and tourism is based on results of adhoc surveys conducted by MONSTAT and for construction at the basis of data from Labour Force Survey and expert estimation of incomes and expenditure of non-residential persons. Non-observed economy for activity education was calculated using formula suggested by OECD.

The following illegal activities drugs, prostitution, sex- trafficking, illegal selling of CDs, video tapes, illegal use of software, smuggling of weapons, etc. are not included.

The classification of economic units by activity is in line with the national Classification of Activities (CA) that is harmonized with the Classification of Economic Activities in the European Community (NACE Rev.1).

Indices of nominal growth = GDP at current prices in current year / GDP at current prices in previous year.
Real growth rate = GDP at constant prices in current year / GDP at current prices in previous year.

Methodology:

Expenditure Approach

The GDP compilation at current prices by the expenditure approach is based on the data from regular surveys of MONSTAT, Ministry of Finance, Central Bank of Montenegro as well as expert estimates for non-available data.

Final consumption expenditure of households was calculated on the basis of data from regular statistical surveys of MONSTAT as well as on data from various administrative sources. The main data source was Household Budget Survey (HBS), which has been harmonized with international standards and EUROSTAT and UN recommendations, thus improving the HFCE compilation and making it internationally comparable. In addition, methodological documents and experiences of other countries were used in order to make the compilation as much as possible in line with ESA'95 and SNA'93 concepts. The data on consumption expenditure by following COICOP groups were used: Food and non-alcoholic beverages; Alcoholic beverages and tobacco; Clothing and Footwear; Housing, water, electricity, gas and other fuels; Furnishings, household equipment and routine

household maintenance; Health care; Transport; Communication; Recreation and Culture; Education; Restaurants and Hotels; Other goods and services (total for all households – agricultural, mixed and non-agricultural). For the Group: Housing, water, electricity, gas and other fuels, the compilation of imputed rent on the basis of international user-cost approach was included, which improved the compilation of household consumption.

Data on Government expenditures were based on data from Ministry of Finance and Annual Budgetary Report of Montenegro. Individual Government final consumption includes expenditures on Education, Health, Social security and welfare and Sport, culture and recreation. Remained expenditures of the government are related to collective consumption (general public services, military and civil defence with ministry, residential and communal services, etc).

Changes in inventories are obtained as a residual while compiling GDP by production approach.

Gross fixed capital formation data for corporate enterprises are based on data of regular MONSTAT survey: Annual questionnaire on investments in fixed assets. Gross fixed capital formation for the unincorporated sector (construction, trade, agriculture, etc.) was estimated on the basis of available data from regular statistical surveys and estimates on transfer of ownership costs.

Data on imports and exports of goods and services were based on the Balance of Payment data of Central Bank of Montenegro as well as on the external trade statistics.

Production Approach

The main categories of GDP compilation by production approach are:

Gross output is defined as a market value of produced goods and services. It is calculated by activities at approximate basic prices, since all subsidies are treated as subsidies on products and included into calculation on the level of national economy.

Intermediate consumption at purchase prices is the value of goods and services, which are transformed, used and consumed in the production process.

Gross value added is the value of gross output less the value of intermediate consumption.

Gross domestic product at market prices is the value of all goods and services produced by resident units, i.e., the sum of gross value added by activities including items not classified by activities on the level of national economy: financial intermediation services indirectly measured (FISIM) as well as taxes on products less subsidies on products

Current prices

Gross value added calculation at current prices is mostly based on Annual Financial Reports of Enterprises as well as on results of regular statistical surveys:

- Complex Annual Reports of governments and non-profit institutions;
- Compilation of output of Private Sector.

The data quality of Annual Financial Report was checked and partially corrected on the basis of data from statistical surveys in agriculture, industry, construction, wholesale and retail trade, tourism, transport, etc.

Additionally, the data sources are data from Central Bank of Montenegro, Tax authorities and Ministry of Finance (Annual Budgetary Report).

Gross value added calculation for activity Real estate, renting and business activities, is compiled by user-cost

approach, which is harmonized with ESA'95 methodology.

The used data were adjusted according to the requirements of SNA'93 and ESA'95 methodologies, while in certain cases particularly estimation were made on the basis of available data.

Constant prices

The calculation of gross domestic product at constant prices was carried out on the basis of available data by simple extrapolation method, using appropriate volume indices.

MONSTAT calculate GDP at constant prices from production side only. Before the recent revision, the first preliminary estimates of the GDP at constant prices for the years 2000-2003 had used 2000 as the base year, while the first preliminary estimate of the GDP at constant prices for 2004 and 2005 had been calculated according to the chain indexes method, i.e. use the prices of the previous year to estimate the aggregate at constant prices for the following year.

Method who we use to compile constant price data is simple extrapolation method. We apply the simple extrapolation method as the best solution according to currently available resources. The simple extrapolation method directly extrapolates value added at current prices by quantity indexes.

Morocco

Source

In Morocco, national accounts are compiled by the Department of National Accounts, which comes under the responsibility of the Office of the High Commissioner for Planning. Official annual and quarterly national account statistics are posted on the website www.hcp.ma and are published in the Moroccan statistical yearbook, and in specific national account documents that can be downloaded from the website.

General

Morocco has put in place the System of National Accounts 1993 (1993 SNA) using 1998 as the base year. The compilation of the 1993 SNA accounts involved the following: review of the 1993 SNA and staff training; determination of the statistical data requirements; preparation of the functional classifications; preparation of statistical surveys and organization of data collection and use; installation and implementation of the appropriate information technology (i.e. the "ERETES" software); study and implementation of methodological procedures; and preparation of the accounts and tables.

The compilation of the national accounts involved a number of large-scale statistical operations, including structural surveys such as: structural survey of corporations that keep financial records (1999-2000 but applied to 1998); survey of the informal sector (1999-2000); surveys on standards of living and on household consumption and expenditure (1998 and 2000-2001); investment survey of general government units (2000 but applied to 1998); comprehensive national survey of rural employment (beginning in 1999); and economic census (2001-2002).

A series of accounts for the 1998-2005 fiscal years was published in October 2006. The financial results for the 2004 fiscal year are semi-final, while those for 2005 are provisional. The provisional results for the 2006 fiscal year were published in June 2007.

In Morocco, the accounts and tables, which are compiled on a regular basis include: supply and use balances by product (278 items); production accounts and generation of income accounts by industry (97 items); supply and use tables; institutional sector accounts (from the production account through to the financial account); rest of the world accounts; tables of financial transactions; and tables of integrated economic accounts.

The Moroccan national accounts are compiled on an annual and quarterly basis. The reference period is the calendar year. The volume accounts are compiled using the previous year's prices.

Methodology:

Overview of GDP Compilation

GDP is calculated using the production approach and the demand-based approach. The income approach was used to compile the accounts and tables of the 1998 base year but was used only partially in the compilation of the accounts of the current years; this involved calculating wages, taxes, production subsidies and general government consumption of fixed capital. GDP is obtained after conducting a review of the supply and use table, which is prepared annually based on current prices and the previous year's prices. The supply and use table is formulated by cross-classifying industries and products since, in the case of non-agricultural market activities; the basic statistical unit taken into account is the enterprise rather than the institution.

In line with the production and expenditure approaches, GDP is calculated at current prices and at the previous year's prices (in volume). In this regard, all production accounts by industry are compiled at current prices and in volume, as well as supply and use balances by product and supply and use tables. The methods used to compile these accounts and tables in volume depend on the nature of the data available and on the nature of the operations, industries and products concerned.

For example, when data are available in current values, the method consists of deflating the available values by the appropriate price indices. However, if the data are provided in quantities, as in the case of the production of agricultural, mining or energy goods, the volume of the relevant operation is calculated by multiplying the quantities by the average prices of the previous year.

Where the information exists only in the form of volume indices, these are directly applied to the relevant operations of the previous year to determine the volume of the current year. If the data are expressed as values and also as volume indices or quantities, the deflation method is preferred to other methods (when data on prices or appropriate price indices are available).

The different methods used should produce results that correspond to the following equations:
Value = Volume x IP (t/t-1) and IVAL (t/t-1) = IVOL (t/t-1) x IP (t/(t-1), where:
IP (t/t-1) represents the price index between the current year (t) and the previous year (t-1);
IVAL (t/t-1) represents the current value index between the current year (t) and the previous year (t-1); and
IVOL (t/t-1) represents the volume index between the current year (t) and the previous year (t-1).

The volume of value added is obtained by the double deflation method, i.e. the difference between the volume of the product and the volume of intermediate consumption for each industry. This volume is obtained, in particular, from supply and use tables expressed in the previous year's prices. Changes in the prices of different added values (the variation in the value added solely due to changes in the prices of production and intermediate consumption) and changes in GDP (the variation in the general level of prices) are deduced implicitly from the relationship between the value and the volume of these quantities.

Price indices for these studies are compiled by referring to the basic indices used to produce official price indices (the producer price index, the consumer price index, the wholesale price index and the foreign trade index) and data on price levels (the producer price of agricultural products, official prices, regulated prices and average prices). The resulting price indices reflect, for each industry or product classification item, the change in price for the relevant operation. Definitive data, in terms of both volume and prices, are shown in the summary supply and use tables.

Volume and price indices generally correspond to the Laspeyres index. The Fisher index is sometimes used, when permitted by the data. The Paasche index is occasionally used for prices.

Expenditure Approach

Final consumption expenditure of resident households is calculated by product based on data from the survey on household standards of living for the base year 1998 and the survey on household consumption and expenditure for 2001. Final consumption expenditure of non-residents is obtained from balance-of-payments statistics and from the results of the survey on international tourism conducted by the Department of Tourism in 2000 and 2003. The data collected from these surveys are then corrected or adjusted through statistical reconciliation and the compilation of supply and use balances by product. For current years, estimates are made by product classification item (278 items) through direct allocation of resources in goods and services or the compilation of supply and use balances, in the knowledge that an initial estimate is made on the basis of the instantaneous elasticities calculated from the survey on household standards of living. Government final consumption expenditure is represented by the difference between the overall output of this sector, on the one hand, and its non-market output and the partial payments made by households, on the other hand. These different operations are determined from budgetary statistics, the administrative accounts of local governments and the accounting documents of public non-profit institutions.

For the base year, estimates of gross fixed capital formation are calculated using data from structural surveys (surveys of formal and informal sector enterprises, general government and households), accounting documents (budgetary and company), foreign trade statistics, agricultural sector data and data on plantations and livestock farming. Gross fixed capital formation is determined by economic agent and by product according to the product

classification selected, which depends on whether these products are local or external (imported) in origin. For current years, foreign trade statistics and data from the annual survey on industrial production are used to obtain indices for the variation in gross fixed capital formation by industrial product according to its origin. Gross fixed capital formation in construction and public works can be determined from accounting data (budgetary and company) and from statistics on construction permits. Agricultural statistics provide information to complement the determination of gross fixed capital formation in agricultural products (plantations and livestock farming). Gross fixed capital formation disaggregated by institutional sector is then deduced. The final figures arrived at correspond to those obtained after balancing and final review. It should be noted that government gross fixed capital formation is determined, for the base year 1998, from the results of the survey on general government investment by subsector and by type of capital asset. For current years, the status of government issues, the status of financial operations of local governments and the accounting documents of different administrative public institutions are used to calculate gross fixed capital formation for the sector.

Changes in inventories are estimated by product, with a distinction made between producer and consumer inventories. For the base year, these two components have been calculated on the basis of data from structural surveys. For current years, changes in producer inventories in industrial products are determined on the basis of the annual survey of processing industries, whereas accounting or administrative statistics are used to calculate inventory changes for other products, such as in the case of mining and energy products. Changes in consumer inventories are also determined, in part, from accounting or administrative data, particularly where agricultural (other than animal farming) and energy products are concerned. For the remaining products, inventory changes are addressed through supply and use balances.

It should be noted, however, that a different approach is used to calculate changes in livestock inventories. The calculation is made, without distinguishing between producer and consumer inventories, on the basis of data from the continuing livestock survey. This makes it possible to distinguish between livestock for fattening (which can be inventoried) and livestock for inclusion in gross fixed capital formation (reproduction, milk production, transport, etc.).

Information on imports and exports of goods and services is obtained directly from foreign trade and balance-of-payments statistics.

Income Approach

This approach has been adopted in full for the base year, through the use of structural surveys and accounting data (company and budgetary). It is carried out only partially for current years by calculating the compensation of employees, other taxes on production net of subsidies, and general government consumption of fixed capital. It is used in its entirety for the financial corporations and general government sectors, on the basis of their accounting documents.

The compensation of employees from other sectors is determined using available annual survey data, particularly the data on processing industries. Annual surveys on other formal market production sectors began in 2005 (for the fiscal year 2004) and have subsequently been conducted on a regular basis for the following fiscal years. This information is supplemented by social security data, annual employment survey data and certain administrative statistics. Finally, other taxes and subsidies on production can be determined from budgetary statistics and the statistics of the relevant public institutions.

Production Approach

The value added by industries is the value of output at base prices less the value of intermediate consumption at purchasers' prices; this does not include the value added by general government, where non-market output is determined by totalling costs.

The agricultural sector is defined using the Moroccan classification of economic activities (NMA), which is in accordance with the third revision of the United Nations International Standard Industrial Classification of All Economic Activities (ISIC). The data were derived from: statistical surveys (annual surveys conducted by the

Ministry of Agriculture on crops production and prices and animal farming); statistics produced by the relevant governmental bodies (such as the departments in charge of agriculture, forestry and fishing); structural household surveys conducted periodically by the Office of the High Commissioner for Planning (e.g. the survey on household consumption and expenditure and the survey on household standards of living); and surveys conducted periodically by the Office of the High Commissioner for Planning on fishing enterprises. Generally, the data available for the agricultural sector refer to aggregate quantities; price data (levels or indices) are then used to convert those quantities into values. Agricultural output may be broken down into plant, animal, forestry and fishing production. For each of these components, calculations are made according to product type. The available statistics are sufficient for most products; where they are not, statistics on demand for agricultural output are used instead.

The mining and energy sector comprises all the activities of mining industries (non-metallic ores, including phosphates, and metallic ores and quarry) and energy industries (oil refining, electricity and water). The output of these industries is determined on the basis of data from: annual reports issued by mining and energy companies or oversight departments; statistics on the mining and energy sector compiled by the Ministry of Energy and Mines; and statistical indices produced by the Statistics Division of the Office of the High Commissioner for Planning. One of the primary sources of statistics used to determine output by industry is the annual survey of processing industries conducted by the Ministry of Industry. This survey primarily covers production, sales and inventory by product, employment, staff costs and a few accounting items, such as operating expenses and some of their components. For the base year 1998, this source was used to supplement the structural survey of this sector. The annual survey does not, however, cover the whole range of processing industries; sole proprietorships and informal enterprises are not included. Their output was estimated directly from the results of the survey on the informal sector for the base year as well as employment statistics (continuing household survey on employment conducted by the Statistics Division) by analysing the annual evolution of output in current years.

For construction and public works at the base year, the statistics used to calculate output were taken directly from structural surveys conducted on formal and informal enterprises in the sector. For current years, output was calculated on the basis of data on household demand for housing and on demand from enterprises for various sector products. This data was used to determine the rates of annual variation of output by value and volume. Estimates of individual and corporate demand for construction are made on the basis of building permit statistics. The figures for the year are based on the matrix of coefficients for the annual implementation of authorized construction projects. As for other demand for construction and public works, statistical sources included accounting data provided by enterprises that are leading consumers of public works products, together with detailed general government budget statistics from both State and local governments.

The transport sector comprises transport by rail, air, sea and roadway, as well as auxiliary transport activities. As in the case of other market activities, the computations for the base year are derived from the results of surveys of both formal and informal sector enterprises. With regard to current years, the output and intermediate consumption of rail and air businesses (passengers and goods) are dealt with directly on the basis of accounting documents provided by entities working in these sectors, particularly the National Railway Office and Royal Air Morocco. Statistics on maritime transport by Moroccan shipping companies are used to analyse changes in that industry, while statistics from the National Transport Office, a government body responsible for regulating road freight transport, are used to estimate the output of such transport. Indirect methods, based on demand factors, are used to analyse the road transport of passengers. The output of auxiliary transport activities is determined using the accounting data of enterprises engaged in managing infrastructure for the various types of transport (ports, airports, road freight transport, haulage depots, highways and gas pipelines) and air and maritime passenger data. Production and operating accounts for the post and telecommunications sector are prepared based on the accounting data of the various enterprises working in this sector.

The finance and insurance sector comprises financial intermediaries, insurance and financial auxiliary businesses. Production and operating accounts were prepared for each type of activity. The output of financial intermediaries (the central bank, Bank Al Maghrib, credit institutions and others) was determined on the basis of these establishments' profit and loss statements and according to the appropriate bridge tables. This output

encompasses both invoiced production (e.g. commissions, rental of safe-deposit boxes, account management and income from apartment buildings, i.e. rent) and the production of financial intermediary services, which is indirectly measured as the difference between financial income (excluding capital) and interest accruals. Insurance output, regardless of whether the product concerned is life insurance or property damage insurance, is calculated as the total of effective premiums received plus total premium supplements less total owed in benefits less change in actuarial reserves and in dividend reserves for insured persons. The output of financial auxiliary businesses is estimated on the basis of insurance companies' profit and loss statements (cost of policy acquisition) and accounting documents of the Casablanca stock exchange and of mutual fund companies.

Rent was calculated on the basis of data from the national survey on household standards of living (1998), the national survey on household consumption and expenditure (2001) and the national household survey on employment (a continuing survey). To comply with 1993 SNA principles, two types of residential rent are distinguished: market rent and non-market rent. The first two surveys were used to calculate both types of rent for the 1998 and 2001 base years. Starting from the baseline data, rents were estimated for current years by calculating the variation index for tenant households who benefited either from free housing or from employer-subsidized housing, and the variation index for owner households or home buyers, using the data provided in the annual employment survey. These indices made it possible to calculate changes in rent volume. The cost-of-living index relative to rent was used to calculate price variations. However, the index was adjusted on the basis of the relative difference between the variation in rent from 1998 and 2001 and the implicit variation in rent prices, which was calculated by comparing the results of both aforementioned surveys. Output of the property development sector was calculated on the basis on the results of structural surveys, which were supplemented with information from a study carried out by the Ministry of Housing on production capacity and the operating methods of property developers. Production of other real estate services (e.g. real estate brokerage) is assumed to evolve in parallel to actual rent.

For other market services, production for the base year 1998 was established in the same way as for other market industries, with the exception of agriculture, that is, directly based on the results of structural surveys conducted on formal and informal sector enterprises. Production for current years was computed using variation indices, which were based on data specific to each type of activity. Thus, the variation indices for output of the hotels and restaurants sector were established on the basis of statistics on tourist overnight stays and balance-of-payments data (especially the "travel" item, which provides information on the expenditures of the international tourism industry), as well as data on the evolution of the restaurant sector. Services rendered to enterprises are calculated using the technical coefficients of the previous year and the outputs of the various consumer segments during the year in question, as well as balance-of-payments data, which allow for estimation of the imports and exports of such services. The variation index for the output of cultural and recreational activities is calculated on the basis of the following data: revenue generated by the national film industry; the tax on the promotion of audiovisual media, which is the main component used to calculate the production of Moroccan television stations; the financial statements of Maghreb Arabe Presse; and the revenue of the national cultural activities fund. Lastly, the output of personal and domestic services was calculated on the basis of final consumption.

The output of non-market services was measured on the basis of production costs (intermediate consumption, remuneration of employees, other taxes on production, and consumption of fixed capital). Intermediate consumption, remuneration of employees, and other taxes on production were calculated using accounting documents provided by the State, non-profit institutions, local governments and social security administrative bodies. Fixed capital consumption was estimated, for the base year 1998, on the basis of the results of the survey on general government investment, by calculating the stock of fixed capital held by government entities and the probable life length and replacement value of each type of capital. For current years, the stock of capital for the year in question is equal to that of the previous year, adding in gross fixed capital formation for the current year, less disposals. This output is augmented by the market output of goods and services, calculated on the basis of the revenue of the sector's components.

For the base year, the agricultural sector's intermediate consumption was calculated by product for each branch of the sector. A figure was reached by combining the results of the household standards of living survey with other

data relating, in particular, to the production and distribution of products that may be used as inputs in the sector's various activities. The data relating to the household standards of living survey are taken from the section of the questionnaires relating to self-employment in agriculture. This section provides information about output, inputs and capital investment for crops and livestock separately. These data are then combined with, or compared to, the aforementioned other data. The latter data generally relate to the supply and distribution of the products in question and are taken from statistical surveys or administrative statistics. The statistics relate to the production, import and distribution of industrial products that may be consumed by agriculture; cultivated areas by category of crop; and agricultural output for intermediate consumption by agriculture, such as animal feed and seeds. As for fishing, statistics relating to intermediate consumption by product were obtained directly from the structural survey (formal part) and the survey on the informal sector. For current years, with the exception of data relating to the structural survey on household standards of living, which is not conducted annually, data are generally available each year. These data are used to calculate price and volume indices for the various items comprising the intermediate consumption of each branch.

To calculate the intermediate consumption of the various branches of the non-agricultural sector, it was necessary, for the base year, to conduct structural surveys of non financial corporations that keep financial records and a survey of the informal sector involving all non-agricultural producer units that do not keep financial records. Part of the questionnaire used in these surveys was reserved for corporations' purchases and expenditure, by product and type of expenditure, and product stocks at the beginning and end of the fiscal year, by price and volume. The data collected in this part of the questionnaire were used to calculate the intermediate consumption of each branch disaggregated by product classification for each type of activity. Intermediate consumption for current years is calculated by projecting the previous year's technical coefficients, which are adjusted on the basis of accounting data relating to the cost of operating and using subsidiaries, and of "cases fixées" (specific data readily available for certain key items), as well as by aligning the data in the context of supply and use balances and the summary supply and use table. Statistics relating to the intermediate consumption of financial activities were taken directly from their accounting documents (breakdown of income and expenditures) for the base year and for the current year.

Taxes on production can be broken down as follows: import duties; non-deductible VAT; domestic consumption tax; and other taxes on production. Generally speaking, statistics for each category of tax are obtained directly from the budgetary statistics of the State and the administrative accounts of local governments. For the purposes of supply and use balances, such taxes are calculated by product in line with the product classification used in the compilation of national accounts, which comprises 278 items. Import duties are calculated on the basis of customs tariffs, which are updated each year, and external trade data compiled in strict compliance with the Harmonized Commodity Description and Coding System (HS) nomenclature. The total is adjusted in line with the figure reached using budgetary statistics. Non-deductible VAT is estimated by product according to type of use, namely intermediate consumption, final consumption expenditure and gross fixed capital formation. With regard to the intermediate consumption and gross fixed capital formation of corporations, part of the questionnaire used in the structural survey was reserved for questions relating to the amount of VAT invoiced and the amount recovered — hence non-deductible — for each product. For current years, for which the structural survey is not available, the previous year's non-deductibility rates are used, before the alignment of data in the context of supply and use balances and the compilation of the summary supply and use table. For sectors such as the general government and informal sectors, which are not subject to VAT and consequently are not concerned with recovering it, the amount of VAT included in the price of the various products they purchase, whether for intermediate consumption or gross fixed capital formation, is calculated on the basis of the regulations in force; these regulations are updated each year when the new finance law is presented. The final consumption and gross fixed capital formation of households is calculated in exactly the same way. Domestic consumption tax and other taxes on production are calculated by product using the direct allocation method, in line with the heading of the budget or accounting items concerned. Statistics relating to subsidies on production are taken primarily from the accounting or statistical documents provided by the administrative bodies concerned, i.e. the Compensation Fund and the National Interprofessional Cereals and Pulses Board. The latter is responsible for flour subsidies, the former for all other subsidies. Subsidies are calculated by product using the direct allocation method.

[a] Petroleum refining is included in Electricity, gas and water supply.
[b] Excludes gas.
[c] Discrepancy between components and total as one or more components have not been revised.
[d] Refers to Industries Education and Health and Social Work
[e] Includes other community, social and personal services only and Private households with employed persons.
[f] Includes Financial intermediation services indirectly measured (FISIM) of Total economy
[g] Excludes Financial intermediation services indirectly measured (FISIM), but FISIM included in industry data

Source

Reply to the United Nations national accounts questionnaire from Instituto Nacional de Estatistica, Departamento de Contas Nacionais e Indicadores Globais, of Mozambique. Previous estimates were published by Instituto Nacional de Estatística in "Anuário Estatistico" and on the Mozambican website, www.ine.gov.mz.

General

The latest estimates, shown in the following tables, are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Estimates are based on responses to a conceptual questionnaire and other available information. Mozambique implemented the use of a new base year of 2003; previously a base year of 1996 was used. All constant price tables reflect the new base year of 2003. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Myanmar

Source

Reply to the United Nations national accounts questionnaire from the Planning Department, Ministry of Planning and Finance, Rangoon. The official estimates and descriptions are published annually in "National Income of Myanmar" and "Review of the Financial Economic and Social Conditions", by the same Department.

General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA) so far as the existing data would permit. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Namibia

Source

The compilation of national accounts statistics in Namibia is undertaken by the Central Bureau of Statistics department at the National Planning Commission Secretariat. Before 1995 and since 1982, the Ministry of Finance compiled the national accounts and published them in the economic review. The Ministry of finance compiled the national accounts according to the 1968 SNA. In 1995 the Central Bureau of Statistics published the national accounts statistics applying the 1993 SNA. These annual estimates are released twice a year in the national accounts publication. The first release is the preliminary estimates which are released in March of each year and the second release is the revised estimates released in August of each year. The latest publication is the national accounts 2000-2007. The national accounts publication is disseminated in hard copies and electronic format posted at the National Planning Commission Secretariat website www.npc.gov.na. Since 2001 the Central Bureau of Statistics has been compiling provisionally quarterly GDP at constant 1995 prices. The provisional quarterly GDP is released with a time lag of 90 days after the reference quarter and is published in the quarterly bulletin of the Bank of Namibia. The quarterly bulletin is available at the Bank of Namibia website www.bon.com.na. The latest national accounts estimates are based on 2004 base year.

General

The estimates provided to UNSD are compiled in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA) since 1995. The Central Bureau of Statistics has published a manual which consists three volumes:

Volume I provides an overview of the 1993 SNA, of concepts and definitions pertaining to main areas of the national accounts.

Volume II describes the scope of Namibia's national accounts, the sources and methods used in compiling them as well as concepts and definitions connected to specific areas.

Volume III is a documentation of the comprehensive computerized system used in the compilation of Namibia's national accounts, System of National Accounts on a PC (SNAPC)

National accounts are intended to describe the development and structure of the economy in a changing reality. Hence the sources and methods must be continually upgraded and adapted to these changes. New economic activities may be launched, new statistical data may be available, sources that are presently used may disappear, etc. In summary there are three kinds of revisions of annual estimates:

- More or less major revisions of time series backwards at regular interval. This should be done every five years in connection with the change of base year.
- Revision of the two latest years are revised once or twice a year because of certain data that becomes available only more than a year after the end of the reference period
- Occasional revisions of estimates of certain variables for more than the latest two years. The aim should be avoid this kind of revisions, but cannot be excluded.

Namibia's national accounts is compiled on calendar year basis (January – December) and the current base year is 2004.

Methodology:

Overview of GDP Compilation

In Namibia, GDP is compiled by the production and expenditure approach. The two approach in theory results in exactly the same figure for GDP; however, in practice this is not the case in Namibia. The reason is imperfections and gaps in the data sources. The production approach is considered the more reliable method and determines GDP both at current and constant prices. The discrepancy between the two approaches is shown in the published tables. Part of the discrepancy is due to the fact that the estimates of changes in inventories are incomplete; estimates are made only for livestock and ores and minerals.

Expenditure Approach

Final consumption expenditure by household includes all expenditure in cash and in kind, by households on goods and services for the purpose of consumption. This item is estimated independently. The commodity flow estimates has provided the method for the estimates have provided the method for the estimates of household consumption. A prerequisite for this estimate has been the availability of detailed import statistics classified by end use categories.

The 2003/04 Household Income and Expenditure Survey provide data for a benchmark estimate for 2004 with disaggregating according to COICOP. While the consumer price index is used on a detailed level to calculate constant prices.

Final consumption expenditure by non profit institutions serving households. The output of such institution, defined as the total cost of producing it, is by definition consumed by the NPISH. Output, at both current and constant prices is obtained through a link to the worksheet for community, social and personal services under GDP by activity. No sales and fees or expenditure on social benefits in kind is recorded at present, thus final consumption expenditure is equal to output.

Final consumption expenditure by government, the estimate is based on accounting records of the central government and estimates for local government are from the accounts of the local authorities. Consumption of fixed capital, both at current and constant prices is obtained through links to the workbook on capital for producers of government services. Intermediate consumption and sales and fees at constant prices, both for central and local government, is computed by using the Namibia consumer price index as a deflator. Compensation of employees in central government at constant prices is calculated by projection with volume indicator based on employment data (number of filled posts according to the State Revenue Fund in the budget document). The implicit deflator for central and local government is used to calculate compensation of employees at constant prices for local government.

Gross fixed capital formation (GFCF) is estimated by type of asset, by industry and by ownership in the Namibian national accounts. The estimates are based on state budget book, data of imports of capital goods and surveys. Constant prices are derived at by deflation by appropriate price indices.

Changes in inventories are calculated for Mining and quarrying, Agriculture and Manufacturing industries only and are based on data on quantities produced and sold, and average unit prices.

Import and export of goods and services are based on Trade statistics and Balance of payments.

Production Approach

Agriculture estimates are compiled and disseminated separately for the commercial farming and subsistence farming. Hunting and forestry are minor activities. Agriculture in Namibia is dominated by livestock with crop and vegetable playing a subordinate role due to climatic condition. Most of the market output of live animals and

animal products is calculated within the commodity flow framework. Basic data on production and unit prices are obtained from the Agronomic Board Namibia, Meat Board of Namibia, Karakul Board, Namibia Agricultural Union and crop assessment report from the Ministry of agriculture. Intermediate consumption, is an assumption that is based on constant prices and reflated using the relevant South African Price Index. For none-market output the main source for basic data is the 2003/04 Household budget survey, which is used for the benchmark estimate.

Fishing is calculated within the commodity flow framework. Data of quantities and unit prices are obtained from the Ministry of Fisheries. The ministry also provides data on Intermediate consumption for the calculation of the value added.

Mining and quarrying is calculated within the commodity flow framework. Data of quantities and unit prices obtained form the Ministry of Mines and Energy. Intermediate consumption is obtained through direct surveys of mining companies. A single indicator deflation approach is used to derive constant price value added.

Manufacturing is calculated within the commodity flow framework. Annual survey of establishments is the source data for this sector. South Africa PPI is used as a deflator.

Electricity Data is sourced from local authorities, the electricity generation company (NAMPOWER) and electricity distribution establishments. Volumes of electricity index and the South African production index are used as deflators. (Double deflation is used).

Water supply Data is obtained from the local authorities and a sole parastatal (NAMWATER) responsible for bulk water supply. Quantitative data is used as a volume indicator for estimates at constant prices of both for output and intermediate consumption.

Construction the source of data is the government administrative records, local authorities and annual surveys to establishments. For traditional houses the source is the population census. Intermediate consumption assumptions are based on 1980 input-output tables.

Wholesale and retail trade, repairs, Output is measured as trade margins realized on goods purchased for resale. Intermediate consumption consists of only goods and services needed to run the trading establishments. Annual survey is the source data and CPI used as a deflator.

Hotels and Restaurant is obtained from annual surveys of respective establishments. Information of output and intermediate consumption is extracted from these surveys. CPI for food and accommodation is used to deflate the current prices estimates to constant prices.

Transport and communication Data is obtained from annual surveys from the respective establishments. The constant prices estimates are obtained by deflation with CPI and PPI South Africa manufacturing.

Financial intermediation Data is obtained from the Central bank, Insurance institutions and Postal banking services. Implicit index used as a deflator for FISIM and CPI for other output.

Government services both for Local and Central government (Data is obtained from annual survey of local authorities and government budget book). Implicit price index from central government is used to deflate local government current price estimates.

The Namibia's national accounts also have estimates for industries such as Real estate and business services; community, social and personal activities. The source data is the household budget surveys, population census, annual economic surveys local authorities and central government. The CPI is used as a deflator.

[c] Refers to Net value, i.e. excludes Consumption of fixed capital.
[d] Refer to acquisition of land.
[e] Refers to statistical discrepancy.

Nepal

Source

The institution responsible for compiling National Accounts estimates is the Central Bureau of Statistics. The NRB (Central Bank of Nepal) is responsible for compiling BOP (Balance of Payments) accounts. Official national accounts estimates are published in "National Accounts of Nepal", an annual publication.

General

In Nepal, the concept of 1993 SNA is used to the extent possible for the compilation of national accounts. It was adopted from the year 2000/01. The most recent publication on national accounts is "National Accounts of Nepal 2000-2007". National accounts are released each year in June/July. Recently the base year and methodology of SNA 1968 was updated. Full details of the national accounts and national accounts methodology are available at www.cbs.gov.np.

Benchmarking of national accounts estimates has become prime need for improving the quality of national accounts statistics. The levels of transactions of many economic activities were based on old surveys and studies. Because of the outdated benchmarks, the changes in the structure of output, input, value added, and capital formation of such economic activities were not revealed. Moreover, the changes in the economy occurred with newly emerged economic activities were not properly covered in the accounting system due to data gap in these areas. As a result, estimates were becoming less reliable and inconsistent.

Realizing the fact, Central Bureau of Statistics initiated the work on benchmarking the national accounts estimates exploring and using the available data from different sources. Data collected from major statistical operations such as Population Census 2001, Agriculture Census 2001, Manufacturing Census 2002, Nepal Labor Force Survey 1999, Nepal Living Standard Measurement Survey (NLSS) 2003 are used intensively to update the level and structure of the accounts. In addition, some fresh surveys covering different areas of the economy are conducted and their results are used to update and establish new national accounts benchmarks.

As the system of national accounts of Nepal is based on international guidelines, the methodological changes taken place internationally needs to be accommodated accordingly. Therefore, Central Bureau of Statistics carried out different activities for implementing 1993 System of National Accounts. To implement the system, an assessment of the situation in the context from the old system (1968 SNA) to a new system (1993 SNA) was made. The methodology and data sources of the Nepal System of National Accounts (NSNA) compilation have been reviewed and updated to the extent possible following the 1993 SNA. Similarly, concepts, definitions and also classifications recommended by the 1993 SNA have been followed, including the fact that each table has the same fiscal year which starts from the middle of July according to the Nepali Calendar and national accounts aggregates in constant prices are reported in the form of volume measures with a fixed base year 2000/01.

Methodology:

Overview of GDP Compilation

The main approach to compile GDP is the production approach. Valuation of national accounts aggregates with FISIM is used. Values of output, intermediate consumption, compensation of employees and other values are valued at producers' prices and at basic prices. While computing taxation, two types of taxes have been taken into consideration: taxes on products and taxes on production.

Classification of industries is based on NSIC (Nepal Standard Industrial Classification, 2000). These industries follow the ISIC recommendations. Note that since the contribution of NSIC division P & Q are insignificant, estimates are included in division O.

Expenditure Approach

The estimates of GDP at current and constant prices are prepared for the period 2000/01-2005/06. The compilation is based on the general identity model: Y = Cg+Cp+Ig+Ip+(X-M), where, Cg is government consumption; Cp is private consumption; Ig is government investment; Ip is private investment; X is exports; and M is imports.

Overview of the Compilation of the Integrated Economic Accounts

In the case of Nepal, only the production account is prepared by industry and other sequence of accounts is not available so far as the institutional sectors and sub–sectors are concerned.

An institutional unit is defined in the system as an economic entity that is capable, in its own right, of owning assets, incurring liabilities and engaging in economic activities and in transactions with other entities. The institutional units that make up the total economy are grouped into five mutually exclusive institutional sectors: the non-financial corporation sector; the financial corporation sector; the government sector; the household sector, and the non-profit institutions serving household sector.

All resident non-financial corporations and quasi corporations are included in the non-financial corporation sector. Non-financial corporations are further divided into public and private non-financial corporations. The principal activity of non-financial corporations is the production of goods or non-financial services. The estimates of non-financial corporations are obtained by cross classifying the transaction by economic activities and institutional units. While compiling national accounts aggregates at industry level, transactions are identified at the same time also at institutional sector level. Hence, a cross tabulation of the transaction by economic activities and by institutional sectors is prepared for compilation purposes. Since the preparation of estimates at institutional sector level requires data in greater detail, NA aggregates are mainly based on the benchmark surveys conducted in the years 2004 and 2005.

The financial corporations sector consists of all resident corporations or quasi corporations principally engaged in financial intermediation or auxiliary financial activities related to financial intermediation. For the estimates of gross value added and other aggregates, financial sector is further divided into sub-sectors- the central bank, other depository corporations, other financial intermediaries except insurance and pension funds, financial auxiliaries, insurance companies, and pension funds. National accounts aggregates are estimated utilizing the financial statistics compiled by the Nepal Rastra Bank and also processing the financial statements of the respective institutions.

Government units may be described as unique kinds of legal entities established by political processes, which have legislative, judicial, and executive authority. The activities of government units are grouped into two levels- central government and local government. The transaction of central government is derived from the government accounts. Central government expenditures are reclassified and regrouped to derive estimates by main functional categories.

To get national accounts estimates at local government level, data are compiled separately for local government bodies – Village Development Committee (VDCs), District Development Committee (DDCs), and Municipalities. Data on the transactions of VDCs and DDCs are collected annually administering some pre-designed questionnaire in a sample basis. This information is processed and used in the compilation of NA aggregates for these local government bodies. In case of municipalities, the report prepared by Urban Development Through Local Efforts (UDLE), Ministry of Local development is utilized to get information on the transactions – output, intermediate consumption, taxes, capital formation etc.

The household sector is defined as 'group of persons who share the same living accommodation, who pool some or all, of their income and wealth and consume certain types of goods and services collectively, mainly housing and food' SNA para. 4.132. The household sector engages in production activities that are directly controlled and owned by the members of households, either individually or in partnership with others. Producer units within the

household sector are all unincorporated enterprises.

The main data source for NA estimates at household sector level is the Nepal Living Standard Measurement Survey (NLSS 2004). Unincorporated household activities (non-agriculture) are identified using the criteria of not registered and without hired labor and grouped them into NSIC two digit level for estimating output, input and compensation of employees. For the estimates of agricultural activities, the value of output is estimated using the production data supplied by MOAC and DOA. Information on price and cost of production is also available from different departments- Department of livestock, Department of Horticulture, Department of Agriculture/ Marketing Development Directorate, District Agriculture Offices, Fish Development Centre, and Department of Forest. Producers of services for own final use- services of owner-occupied dwellings are estimated using NLSS survey data.

Non-profit institutions are legal or social entities created for the purpose of producing goods or services with non-profit motives. By virtue, these institutions are not permitted to generate operating surplus. The estimates of transactions of NPISHs are based on the survey on NGOs and INGOs (CBS 2002). The survey result provides information on economic transactions – output, input capital formation and compensation of employees. The number of NGOs is used as an extrapolator to get the estimates for other years. Since NPISHs operate non-market transactions like the government, estimates are inflated by the same wage index (public sector wage index) that is used for government services to derive estimates at current prices. The national accounts estimates from NPISHs are merged into the household sector, since it does not permit to prepare separate accounts because of the insufficiency and irregularity of input data required for the compilation.

The rest of the world consists of all non-resident institutional units that enter into transactions with resident units, or have other economic links with resident units. The rest of the world account is compiled using balance of payment (BOP) statistics as published by Nepal Rastra Bank. The BOP data is reclassified and used in the compilation of the activities of the rest of the world. Since there is complete concurrence between the 1993 SNA and BOP –V, the relevant portion of the BOP data, e.g., factor income, current transfers, exports and imports of goods and services are received and used in the compilation of NA estimates of GNI, GNDI, GNS.

Netherlands

Source

The preparation of the national accounts statistics in the Netherlands is undertaken by Statistics Netherlands in Voorburg. The official estimates, together with methodological notes, are presented annually in the publication "Nationale rekeningen". An English version of this publication is also available (National Accounts of the Netherlands). The national accounts figures are also available on the internet in StatLine, the electronic databank of Statistics Netherlands: www.cbs.nl.

A detailed description of the concepts, definitions, data sources and estimation methods is given in the publication "Gross National Income Inventory 2001, The Netherlands". This publication gives numerical results for the reporting year 2001 as well. The inventory can be consulted on the CBS-website. Data sources and estimation methods of price and volume changes are described in the publication National accounts of the Netherlands.

The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. The data was received through the Organization for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). The first annual publication on input-output tables, covering the years 1948-1957, was issued in 1960. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. Chain indices are used to measure volume growth and the resulting chained constant prices data are not additive.

On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of Netherlands the currency name for the data before 1999 is "1999 NLG euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 2.20371 Netherlands guilder. - The name of the currency of the newly submitted data is "1999 NLG euro" for the data before 1999 and "euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for the Netherlands, like for example all old data following the 1968 SNA is still in "Netherlands guilder", although this is not specifically indicated in the tables.

In July the annual national accounts estimates are available in StatLine, the electronic databank of Statistics Netherlands. It concerns provisional estimates for the two most recent years and "definitive" estimates for earlier years. Provisional data are subsequently adjusted; definitive published data are generally not revised in subsequent publications, they remain unchanged until the next benchmark revision.

From time to time benchmark revisions of national accounts data are carried out. The level estimates are then adjusted in line with the latest insights, concepts, definitions, classifications, estimation methods and the like. A benchmark revision also allows mistakes to be corrected. The most recent benchmark revisions relate to the reporting years 1969, 1977, 1987, 1995 and 2001. After a benchmark revision the existing time series are adjusted so that comparability in time remains possible.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach. The expenditure and income approach are also used. Supply and use tables and input-output tables are compiled annually, both in current prices and in prices of the previous year. The national accounts data are compiled to cover only the official geographical area of The Netherlands, i.e. they exclude Aruba and the Netherlands Antilles.

Expenditure Approach

Expenditure is estimated in the context of the supply and use table, both in current and in constant prices, where independent estimates of output, intermediate consumption and final use are compared and brought into balance. This integrated procedure ensures the consistency and the equality of GDP estimates using the expenditure and production approach.

In estimating household final consumption expenditure, household budget surveys and retail output statistics are used. The commodity flow method plays an important role in estimating household final consumption expenditure. Main sources for the estimates of government consumption expenditure are administrative records. Fixed capital formation estimates for the various industries are largely based on separate surveys of expenditure by tangible fixed-asset type. Administrative records are also an important source; this refers for example to annual reports and balance sheets of banks, insurance companies and government, to data from tax authorities. For software, the output growth minus exports plus imports is used to extrapolate a survey level from a few years back.

Foreign trade statistics are the major source for data on imports and exports of goods. For companies not included in the surveys, estimates are made using the Ministry of Finance VAT tapes. The estimates of the international trade in services is based on a sample statistics, main sources are reports from 300 large enterprises, reports from a sample of 1500 small and medium-sized enterprises, household surveys and surveys of tourist accommodation providers, data from the Ministries of Foreign Affairs and Defence.

Constant price figures are obtained through deflation with price indexes for nearly all final expenditure components. These figures are compiled within the framework of supply and use tables in constant prices.

Income Approach

The compilation of gross domestic product with reference to the income approach involves its estimation as the sum of the different components of value added, namely compensation of employees, the balance of other taxes and subsidies on production and gross operating surplus/mixed income.

From the point of view of income, GDP can be estimated in different ways; for example with reference to: value added components for the entire economy, value added components on an industry level, value added components on the level of institutional sectors and a combination of these options. In the Netherlands the combination option is used. All available information is combined in the matrices describing the relationship between industries and sectors. These matrices are used to divide the results from the supply and use table into the main components of the income approach, compensation of employees and gross operating surplus.

The calculation of domestic product from the income point of view is largely based on direct estimation methods. A great variety of statistical sources can be drawn upon, in many cases the same ones used in the production approach. Estimates of wages and employers' social contributions are largely based on the Social Statistical Database. This database is realised by integration of data on employees from different sources (e.g. tax authorities and institutions responsible for the administration of social security).

Subsidy and tax estimates are based on figures from government registers. Many sources are available for the

determination of operating surplus/mixed income. Estimates of the consumption of fixed capital are made with the perpetual inventory method.

Production Approach

The production approach is used to estimate value added of most industries. From the point of view of production, gross domestic product at market prices is estimated with reference to annually compiled supply and use tables both in current prices and in prices of the previous year.

For agriculture sources of information are survey-based production statistics and administrative records for forestry and forestry services. For the growing of crops, market gardening, horticulture and the farming of animals, functional estimates rather than institutional estimates were made by combining exhaustive data from surveys, administrative records and commodity flow models.

Regarding mining and quarrying survey-based production statistics are the main data basis. The information base for manufacturing are survey-based production statistics. For a number of industries corrections are made to make the data from the survey-based production statistic consistent with survey data on produced volumes provided mostly by commodity boards.

For electricity, gas and water supply survey-based production statistics are the basis for the national accounts figures. Information about the turnover of trade activities is also used. For construction survey-based production statistics are available. The basis for the estimates of wholesale and retail trade figures are survey-based production statistics. The same holds for hotels and restaurants.

Estimates for transport, storage and communications are based on survey-based production statistics. Corrections are made to change the gross administration of certain activities in the production statistics into the net administration of national accounts. Annual reports of a state company are used as well.

The main data sources for the estimates of financial intermediation are administrative records, for example annual reports of the Dutch Central Bank and the Insurance Board. For Special Purpose Entities exports and imports are taken from Central Bank's balance of payment data. In some cases (for instance exchange bureaus and mortgage agents) extrapolations are made based on historical data from 1995 using growth rates of closely related industries.

Estimates for real estate activities are based on survey-based production statistics. Exploitation of houses is estimated on the basis of the number of houses per type and the average rent per type. For the exploitation of buildings other than houses extrapolation techniques are used.

The value added of government services is mainly based on administrative records. For ministries data are taken from the State record of Statistics Netherlands, which was obtained from accounts and budgets of the ministries. For, among other things, provinces, district water boards, public corporate organizations, executing bodies of social security schemes data are obtained from annual financial reports. Consumption of fixed capital is calculated using the PIM method.

Administrative records are used for secondary and higher education (colleges and universities). Extrapolation techniques are used for e.g. primary education and 'other education'. The estimates of health and social work activities are based on various surveys. For boarding schools and advisory services extrapolations are used.

For the estimates of other community, social and personal service activities survey-based production statistics and other surveys are used. Administrative records are also utilized, for instance for government environmental services provided by district water boards this refers to their annual financial reports. In addition extrapolations on data from surveys are used.

Supply and use tables are compiled in both current and previous year prices. This means that for all transactions

in those tables volume changes can be determined. The estimation procedure applied for value added in previous year prices depends on the type of production.

Value added in constant prices of industries producing market output is estimated with the double deflation method. In case of industries mainly producing non-market individual goods and services (for instance subsidized education) output in constant prices is estimated by multiplying output in the previous year by the volume index of output. Total value added in constant prices is the difference between deflated gross output and deflated intermediate consumption of goods and services. For the majority of the production of non-market individual goods and services volume indicators are available. The main example is educational services.

In the case of industries mainly producing non-market collective services (public administration) value added in constant prices is calculated as the sum of labour costs, other taxes and subsidies on production and consumption of fixed capital in constant prices.

The main sources in the estimation of price and volume changes are producer and consumer price indices. Examples of other data used are: quantity indicators, unit value indices and price and quantity data from agriculture related agencies. The number of passenger kilometres is used as an indicator for passenger transport. The number of pupils is used as indicator for the production of education. Unit-value indices are used for deflation in some specific cases, for instance the exports and imports of certain agricultural products.

Netherlands Antilles

Source

The Central Bureau of Statistics of the Netherlands Antilles (consisting of Curacao, Bonaire, St.Maarten, St.Eustatius and Saba) is responsible for the official compilation of National Accounts statistics. These statistics are published annually on the internet (www.cbs.an) in the publication "National Accounts Netherlands Antilles", as well as in the annual Statistical Yearbook Netherlands Antilles. Official estimates and detailed information on concepts, definitions, sources and methods of estimation utilized are published by the Bureau in "National Accounts Netherlands Antilles 1997-2004". The estimates beginning 1979 exclude Aruba.

The recent publications containing National Accounts statistics are:
- National Accounts of the Netherlands Antilles 1996-1999
- National Accounts of the Netherlands Antilles 1997-2004
- Statistical Yearbook Netherlands Antilles 2004
- Statistical Yearbook Netherlands Antilles 2005
- Statistical Yearbook Netherlands Antilles 2006

General

The system of national accounts of the Netherlands Antilles is based on the concepts and definitions recommended in the SNA93 manual as far as the data availability allows it. As recommended by the SNA93, the central framework of the SNA93 in the Netherlands Antilles consists of:

• Integrated economic accounts (IEA) in which the full set of accounts of institutional sectors and the rest of the world are presented. The integrated accounts are presented for the Netherlands Antilles, Bonaire, Curaçao and the Windward Islands. Due to lack of data no separate IEA's can be compiled for St.Maarten, Saba, and St. Eustatius.

• Supply and use tables (SUT) in which the accounts of industries according to kind of economic activity, and the accounts of transactions in goods and services according to type of product are integrated. This publication contains a summarized SUT for the different geographical areas.

• Cross-Classification of Industries and Sectors (CCIS), in which transactions are cross classified by industries and sectors. This is the only table with separate information regarding St.Maarten, Saba and St.Eustatius.

Both the publications "National Accounts Netherlands Antilles 1996-1999" and the "National Accounts Netherlands Antilles 1997 -2004" are based on the SNA 1993. The previous publications are based on SNA 1968. The revision from the SNA68 to the 1993 system was done in close cooperation with the United Nations Statistical Division, Statistics Netherlands and a private Dutch consultancy firm. In these publications data are in ANG (Dutch Antillean guilder) with a fixed US rate of 1.82.

Methodology:

Overview of GDP Compilation

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach. Expenditure and income approach are also compiled. Supply and Use tables are currently not compiled annually but at a lower frequency. No Input-Output tables are compiled.

General notes regarding the production and income approach

An important data source for especially the Non financial, Financial, Household and Non Profit Institutions Serving Households sector is the yearly national accounts survey. The results of this survey provide information about the profit and loss account and the balance sheet. This survey excludes commercial banks, unincorporated government enterprises, taxis, bus drivers, domestic services and the government sector.

In the survey three different questionnaires are being used namely: the general enterprise survey excluding commercial banks, unincorporated government enterprises, taxis, bus drivers and domestic services, enterprise survey for insurance companies and pension funds, and enterprise survey for credit unions.

The difference between the questionnaires has to do with the way the output is being calculated. As stated in the SNA manual the output of insurance is equal to premiums earned plus the premium supplements plus/minus the changes in the technical reserves minus the claims/benefits paid. The output of the credit unions is equal to the interest and fees received minus paid. The output of the other industries is calculated as the gross turnover minus changes in inventories and the output for trade as the trade margin.

This survey is an important data source for national accounts. All enterprises, except for the aforementioned exclusion, with 10 or more employees receive a questionnaire. From the enterprises with less than 10 employees a random sample is taken. Once an enterprise is selected in the sample it stays in it for four consecutive years.

The survey covers about 30 percent (=1900) of all enterprises in the Netherlands Antilles. It is conducted separately for the different islands of the Netherlands Antilles namely Curacao, Bonaire and the Windward islands consisting of St.Maarten, Saba and St.Eustatius. The organization of the survey and control and processing of the data takes place in Curaçao.

Part of the survey in Curaçao (about 400 of the 1100 selected businesses on this island) is conducted via mail. Enterprises with 10 or more employees, which responded well each year, were selected for this "mail survey". The data regarding the other enterprises are collected by a total of 11 interviewers.

The response from this survey is relatively high, about 75 percent, partly due to a law, which stipulates that each company is obligated to cooperate. In case of refusal to cooperate the Central Bureau of Statistics has the means to take the necessary steps to secure cooperation in the future.

Part of the processing includes adding the International Standard Industrial Classification codes (ISIC rev.3) to the different enterprises. The data from corresponding enterprises are then grouped to industries and sectors to arrive at sample totals. These totals are inflated with a three-year average of the number of employees as measured by the labor force sample survey to arrive at the total population. The data from the labor force survey do not have a sector dimension. On the basis of the sector ratios in the 1998 business census total employment by industry and sector is being calculated.

The questionnaire of this survey provides information about the profit and loss account and the balance sheet. The following data by enterprise can be derived from it:

- Output
- Intermediate consumption
- Wages and salaries
- Profit tax
- Gross capital formation
- Depreciation
- Interest, dividends and retained earning

The survey doesn't include commercial banks, unincorporated government enterprises, taxis, bus drivers and commercial housekeeping activities. The data regarding these activities are derived from other sources e.g.

commercial bank activities are derived form central bank data, and data regarding unincorporated government enterprises from the accounts of the government, and the annual reports of those enterprises.

Classification of taxes

The taxes are divided in taxes on products, and other taxes on production. The taxes on products in the Netherlands Antilles consist of e.g. import duties, export taxes, excise on beer and liquor. The other taxes on production consist in the case of the Netherlands Antilles mainly of taxes on the ownership or use of land, motor vehicle tax paid for company cars, legal charges and license fees. A category of taxes that is related to income is the category current taxes on income and wealth divided into taxes on income (wage tax, profit tax, income tax) and the other current taxes on income. In this category the personal use of vehicles is recorded. The information regarding taxes and subsidies is obtained directly from the records of the various governments.

Classifications

The classification of industries is according to ISIC rev.3. The classification of sectors is according to the classification of institutional sectors as mentioned in Annex VA of the manual on a two digit level. The classification of transactions and other flows is according to Annex VB. The classification of the goods and services in the Supply and Use tables is based on the Central product Classification (Annex VG of the manual). For government transactions the COFOG (Classification of functions of the government, Annex VI) is used.

Expenditure Approach

The estimates of government final consumption expenditure are based on the accounting records of the island and central departments of Finance and the annual reports of government unincorporated enterprises.

Household final consumption is calculated on the basis of a 5-yearly Budget Survey extrapolated for recent years by inflation and change in the number of households. This figure is then adapted for the difference between the use and supply of products.

Gross fixed capital formation of the different sectors and industries is mainly based on the yearly national accounts survey. GFCF on owner occupied dwelling is based on a combination of census data and data from the Department of Public Works. The GFCF of the commercial banks and government are based on the respective annual reports.

The estimates of exports and imports of goods and services are based on foreign trade and balance of payments statistics.

Constant price estimates are calculated by deflation of the consumer price index.

Income Approach

Direct information is available on compensation of employees for the different sectors and industries on the basis of the yearly national accounts survey, and additional data regarding commercial banks, unincorporated government enterprises, taxis, bus drivers, domestic services and the government sector. Operating surplus is basically derived as a residual item. In the case of the government sector, data are obtained from the accounting records of government bodies. Depreciation data is also derived form the aforementioned sources.

Production Approach

The production approach is used to estimate value added of nearly all industries, as output minus intermediate consumption. The data are mainly derived from the aforementioned yearly national accounts survey. An exception is the estimation of value added of public administration and defense. In this case the income approach is being used.

Output is calculated as the gross turnover minus the changes in inventories for almost all enterprises/production units. The exceptions are mentioned below.

a. The output of financial intermediary services (ISIC 65)
This is basically calculated as the difference between the interest, fees and commissions received and the interest paid. An exception is being made for the international financial enterprises. With regard to the latter the ISIC is adapted in the sense that the following four categories were added:

- Trust companies (isic 65950)
- Financial holdings (isic 65960)
- Off-shore banks (isic 65970)
- Individual offshore companies with employees (isic 65980)

The output of these enterprises is calculated as the sum of the costs, consisting of labor costs, depreciation, and intermediate costs, and profit tax paid.

The commercial bank data is derived from the consolidated income statements of commercial banks (administrative data source), while the data regarding the international financial institutions is derived from the general questionnaire. (see income statement commercial banks)

b. Output of Insurance and pension funding, except compulsory social security
The output of insurance companies both life and non-life is calculated as premiums earned plus premium supplements minus claims plus/minus additions to reserves. Data source is the consolidated profit and loss accounts of insurance companies as published by the central bank.

c. Output of the oil refinery
In the former System the oil refinery was treated as being part of the rest of the world. In the present System the refinery is treated as a resident enterprise. The output is equal to the refining fee, which is exported. This is related to the resident concept and production boundary in the SNA93.The value added is then calculated as to be the difference between output and intermediate consumption.

Reply to the United Nations national accounts questionnaire from the Institut de la Statistique et des Etudes Economiques (ISEE), Nouméa, Nouvelle-Calédonie.

General

The estimates shown in the tables below have been adjusted by the Institut de la Statistique et des Etudes Economiques (ISEE) Nouméa, Nouvelle-Calédonie in accordance with the United Nations System of National Accounts 1993 (1993 SNA), so far as the existing data would permit. When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

New Zealand

Source

New Zealand's national accounts statistics are prepared annually by the National Accounts business unit of Statistics New Zealand, the National Statistical Office, located in Wellington. The official estimates are published on the internet (www.stats.govt.nz), and featured in publications including Hot Off the Press Bulletins, QuickStats and the Statistical Yearbook. The data provided to UNSD is received through the Organization for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (SNA93). Data is disseminated in New Zealand dollars with industry statistics classified according to the Australian and New Zealand Standard Industrial Classification 1996 (ANZSIC96). The fiscal year utilized is 1 April–31 March with the base year for constant price estimates being 1995-96.

The annual production and expenditure GDP accounts are released twice annually. The release includes the provisional accounts for the latest March year and the revisions to earlier years. The industry analysis of GDP (the production accounts), on which the constant price industry value added series are based, are normally available up to year n-3.

Revisions to the previously published series may be made each quarter. The frequency and cause of these revisions are as follows:

• Quarterly: additional data becoming available for the latest quarters, which is used to replace existing estimates; revisions to quarterly data (eg revisions to the Balance of Payments or Retail Trade Survey), which will be incorporated as soon as possible to maintain consistency between published macro-economic statistics.

• Annual: introduction of annual data following the release of the latest annual national accounts each year; annual updating of the weights used to combine component series to totals and subsequent chaining.

• Irregular: for example methodological changes. However, note that revisions of this nature are, as far as possible, incorporated to coincide with the annual cycle of revisions outlined above.

In addition, each of the above causes for revision, and/or the addition of a new point in the actual quarterly series, has the potential to alter seasonal factors and therefore may lead to a revision in the seasonally adjusted series.

Methodology:

Overview of GDP Compilation

In the New Zealand System of National Accounts, the items making up GDP and expenditure on GDP are estimated independently using diverse data sources. Annual supply-use analyses (for the years 1987 to n-3) result in balanced GDP and expenditure accounts which are published as final estimates. The results for the most recent 2 years are published as provisional estimates at the total economy level. The income and expenditure measures of GDP are used in the calculation of provisional estimates.

Expenditure Approach

The expenditure-based measure of GDP is obtained by summing the components of final demand comprising:

• Government final consumption expenditure – estimates are derived from production accounts compiled mostly from data obtained through the Central Government Financial System (CFIS) and the Local Authority Survey.

• Household consumption expenditure of goods and services – predominantly obtained from quarterly Retail Trade Surveys and the Household Economic Survey. Expenditure overseas by New Zealand resident households and expenditure in New Zealand by foreign tourists is obtained from Balance of Payments (BoP) statistics.

• Gross fixed capital formation by industry – estimates are derived by reconciling supply-side economy-wide totals by asset type and demand-side industry estimates. The Annual Enterprise Survey (AES) is the key data source used to compile industry statistics, supplemented with data from annual reports, central and local government surveys and the Agriculture Production Survey. For residential and non-residential building investment, the all-sector totals are derived using work put in place from the quarterly Building Activity Survey. In terms of transport equipment, some of the components are valued as the number of new vehicle registrations multiplied by an average price, with the remainder calculated as the value of imports plus domestic production. The plant, machinery and equipment all-sector total is calculated as the value of imports plus domestic production.

• Changes in inventories – estimates are based mostly on quarterly wholesale and retail trade stock surveys. Other sources used include the Agriculture Production Survey, statistics from the Ministry of Agriculture and Forestry (MAF), and the AES.

• Exports and imports of goods and services – estimates are based on overseas trade data and BoP statistics.

Income Approach

The income-based measure of GDP represents the income earned from production in New Zealand, whether that is carried out by New Zealanders or foreign firms operating in New Zealand. This is comprised of:

• Compensation of employees – estimates are obtained from labour market statistics, tax data, AES results, annual report analysis, central and local government surveys.

• Operating surplus – derived as a residual item. Taxes on production and imports, and subsidies are obtained from CFIS.

• Consumption of fixed capital at replacement cost – estimates are obtained from the capital stock perpetual inventory method.

Production Approach

The production-based measure of GDP is calculated as the total market value of goods and services produced in New Zealand after deducting the cost of goods and services utilised in this process, but before the deduction of consumption of fixed capital allowances.

Most industry production accounts are compiled from income and expenditure data sourced from the AES. These may be supplemented by data derived from other sources including annual reports, the Quarterly Manufacturing Survey, the Quarterly Employment Survey, the Labour Cost Index and the Producers Price Index. There are some exceptions:

• Agriculture value added - obtained by deducting the cost of inputs from the gross value of production. Output is calculated as the sum of sales and stock change by product. Volumes data is derived from a number of sources including the Agriculture Production survey, livestock slaughter statistics and annual reports, whilst prices data is collected from organizations including MAF and Meat and Wool New Zealand.

• Government value added – compiled from data obtained through the CFIS and the Local Authority Survey.

• Industry value added – industry value added for the following is calculated using a number of sources other than AES: water supply, owner builders, superannuation operation, residential and commercial property operators and developers, owner-occupied dwellings, private households employing staff and religious organizations.

For constant prices estimates, the industry 'elemental series' that make up the production-based GDP, in most cases, are calculated by extrapolating value added, using indicator series that represent the quantities of output produced. Double deflation is not widely used with the only exceptions being for the agriculture and electricity industries on a quarterly basis, and for water transport and business services on an annual basis.

The chain-volume measures of GDP and expenditure on GDP are constructed by:

- compiling a Laspeyres volume index of the component in question, using the previous year's prices as weights; and then

- chaining the sequence of annual movements to produce a continuous time series.

This procedure is used at different levels within the accounts. For example, GDP is compiled by weighting together the individual industry value-added components to produce a Laspeyres volume index for each quarter, and then linking the resulting indexes to produce the GDP time series. Each industry component, such as transport and communication, is also a chained-volume series. At this lowest level, the 'elemental series' are not chained and are either single series in their own right or fixed-weight series comprising a number of components.

[a] Gross value added is evaluated at producers' prices.
[b] Includes Financial intermediation services indirectly measured (FISIM). Gross value added is evaluated at producers' prices.
[c] Data for this item has not been revised. Refers to taxes less subsidies on products less FISIM.
[d] Chained-linked volume measures are presented in this table, thus discrepancies between components and total may exist.

Nicaragua

Source

The compilation of national accounts in Nicaragua is the responsibility of the National Accounts Department, which is part of the Office of Economic Studies of the Central Bank of Nicaragua (CBN). Estimates are made annually and are published in current and constant terms three months after the end of the reference year. Final figures are published two years later, mainly because many companies close accounts at the end of the fiscal year. In the particular case of Nicaragua, the fiscal year is from July to June of the following year, which delays the submission of financial statements and the completion of annual survey forms. For example, final figures for 2004, preliminary figures for 2005 and estimated figures for 2006 were contained in the 2006 annual report, published in March 2007.

Official figures are contained in two documents compiled by the CBN: the annual report and the Yearbook of Economic Statistics, 2001-2006. These documents are available to the public in hard copy and are also published online on the CBN website: www.bcn.gob.ni. The concepts, definitions, basic statistical sources and estimation methodologies for the different sectors of the economy are available in the document entitled "System of National Accounts of Nicaragua, Base Year 1994", published in May 2003 (and posted in digital form on the CBN website). This document describes the methodology used in the process of calculating the 1994 base year for each and every sector of the economy, and the results obtained from this process.

General

Until May 2003, the compilation of national accounts in Nicaragua was based on the methodological recommendations of the 1968 United Nations System of National Accounts. Estimates at constant prices had 1980 as the base year and gross domestic product (GDP) was calculated using the production and expenditure approaches alone. The CBN National Accounts Department is presently once again implementing a programme to change the base year from 1994 to 2005. This will make it possible to update Nicaragua's productive structure by economic activity; to move forward with the adoption of the recommendations in SNA93, mainly with regard to the compilation of accounts by institutional sector; and to incorporate methodological improvements and new statistical sources (2005 Living Standards Measurement Survey, 2005 Eighth Population Census and Fourth Housing Census, 2006 National Survey of Household Incomes and Expenditure, etc.).

Methodology:

Overview of GDP Compilation

GDP is calculated using the production approach (economic activities), the expenditure approach (types of use) and the income approach (types of income). In the case of Nicaragua, a national classifier of activities and products (CNIC) was set up. This is fully harmonized with the International Standard Industrial Classification of All Economic Activities (ISIC) and the Central Product Classification (CPC), which ensures international comparability between Nicaragua and the other countries that have adopted these classifiers.

Expenditure Approach

This approach consists of the following concepts: household consumption, government consumption, non-profit institutions serving households, fixed capital formation, changes in inventories and exports and imports of goods and services.

Household consumption

A final consumption vector for the year 1999 was calculated using the 1999 Survey of Household Incomes and Expenditure (CBN/National Institute of Information for Development (INIDE)), which covered 17 urban departmental capitals. The remaining urban and rural areas were covered by the 1998 Living Standards Measurement Survey (INIDE). Extrapolations were made back to 1994 using this vector, to allow for comparison and reconciliation with the base year vector, elaborated on the basis of the 1993 Living Standards Measurement

Survey. The vector for 1999 was extrapolated for the subsequent years.

Government consumption
Data sources for the calculation of public consumption are the same as for government activity.

Non-profit institutions serving households
Data sources for the production account of non-profit institutions serving households are the following: list of non-profit institutions registered with the Ministry of the Interior, with details of income and expenditure, and financial statements from non-profit institutions registered with the Ministry of the Interior.

Fixed capital formation
Public fixed capital formation is obtained from data on public sector investments (both central government and autonomous entities). This data is broken down into the following components: construction, machinery and equipment, and other investments. The "machinery and equipment" component for private fixed capital formation is obtained from the difference between total imports of capital assets (from customs records) and the public equipment and machinery component. For its part, private construction is obtained from the quarterly survey of private construction, where the value of the square metres obtained is determined by their economic use.

Finally, the "other private investments" component is an aggregate of the estimates investments made in each branch of economic activity. This component is calculated based on data provided by the Ministry of Agriculture and Forestry, which includes the value of new plantations, such as coffee, sugar cane, bananas and pastures. The component also includes the value of heifers, stallions and egg-laying hens, data on which is obtained from customs records, and the value of new forest plantations, such as pine, data on which is supplied by the Ministry of Natural Resources and Environment.

Changes in inventories
Inventories for some industrial products are obtained from the CBN annual survey of the different economic sectors, while inventories for the remainder are obtained from adjustments to the supply and use table.

Exports and imports of goods and services
The Customs Department (DGSA) database is used to calculate foreign trade in current and constant prices. Constant values of exports and imports are calculated by volume and value and by the unit value of a basket of goods, with unit value indices being calculated by CNIC based on a fixed base year (1994) and on a sliding year.

Income Approach

Compensation of employees
Two methods are used to calculate the compensation of employees:

Direct method: This method consists in using data on remunerations obtained directly from financial statements in the following areas: electricity, drinking water, financial intermediation, general government, insurance companies and post and telecommunications services. Data from annual surveys is used to obtain remunerations for industry, services and mining activities.

Indirect method: This method consists in calculating remunerations for agricultural activities and private construction activities based on the labour requirements per planted and harvested manzana (1 manzana = 0.7 hectare) and per square metre of construction, respectively. The basic data used to calculate remunerations for coffee, sugar cane, basic grains, bananas and oilseed crops are the harvested manzanas of each crop, the unit cost, and the technical requirements of permanent and contracted labour. This data is obtained from the 1994 technological maps of the National Development Bank and from the technological maps of the Ministry of Agriculture and Forestry. Remunerations for other agricultural crops are calculated using data from the production accounts for each crop, since data on harvested areas is not available for every year.

Operating surplus and mixed income

These comprise the accounting balance of the income generation account and are separated in each economic activity, based on responses to the annual survey of the manufacturing and service industries on the legal status of companies and the classification of their accounting records:

(1) Companies which are not legally constituted (and instead have the status of natural persons) and which do not record their transactions with other sectors of the economy, or their assets and liabilities, in financial statements, are considered to be household companies, and the balance is classified as mixed income;

(2) Companies which are not legally constituted (and instead have the status of natural persons) and which record their transactions with other sectors of the economy, and their assets and liabilities in financial statements, are considered to be quasi-corporations, and the balance is classified as gross operating surplus;

(3) Those companies which are legally constituted and have formal accounting are considered to be corporations, and the balance is classified as gross operating surplus. In the case of agricultural, pastoral, fishing and forestry activities, the mixed income and the surplus are separated using the structure of household and business output, as reported in the sectoral surveys.

Taxes less subsidies on production and imports
The main sources of data used to calculate taxes less subsidies are the Revenue Department (DGI) database on collection by tax type and economic activity; the Customs Department (DGSA) database by tax type and tariff heading; revenues of the Municipality of Managua and other local governments; and revenues of the National Institute of Technology. Taxes on domestic and imported products are obtained from databases provided by the Revenue Department and the Customs Department and are classified in accordance with the Central Product Classification and the national classifier of activities and products for inclusion in the supply and use balances.

Production Approach

Agriculture, animal husbandry, fishing and forestry
The following data sources are used to compile production accounts on activities and on the supply and use balances for these products:
(1) Annual agricultural production survey (first, second and third seasons), conducted since 1994 by the Ministry of Agriculture and Forestry in coordination with CBN; and the 1998 survey on non-traditional crop production;
(2) Export crop cost survey: coffee, 1996/1997 cycle; sugar cane and bananas for export, 1997; livestock cost survey, 1997; and the 2000 survey of oilseed crop costs and logging and fuel wood production costs;
(3) Ministry of Agriculture and Forestry price and market bulletins, and technological charts for various crops from the defunct National Development Bank;
(4) Third National Farm Census, 2001, conducted by the National Institute of Statistics and Censuses (NISC);
(5) The vector of final household consumption accounts, compiled from the 1993 and 1998 Living Standards Measurement Survey (INIDE) and from the 1999 National Survey of Household Incomes and Expenditure (CBN/INIDE);
(6) CBN model for estimating herd growth and milk output;
(7) Municipal and industrial slaughterhouse statistics, Ministry of Agriculture and Forestry;
(8) Annual bulletin and first national census of fishing and aquaculture, 1995 (both provided by the Nicaraguan Institute of Fisheries (INPESCA));
(9) Annual survey of production costs for fishing, 1997;
(10) DGSA and DGI databases, which are processed to obtain figures for exports, imports and taxes for products in accordance with the national classifier of activities and products (CNIC);
(11) Data from other institutions, companies and producers' associations.

In the case of primary sector commodities, annual volumes and prices are maintained in order to obtain current values. The volume and price index is then calculated for each of these in order to obtain values in constant prices for each product.

Manufacturing

The following data sources are used to compile production accounts on activities and on the supply and use balances for these products:
(1) Annual manufacturing survey (since 1992): used to collect data on legal status, production, prices, employment, inputs, changes in inventories and fixed capital movement, among other things;
(2) Quarterly survey of economic sectors: used to supplement data on companies not covered in the annual survey;
(3) Monthly manufacturing survey: used to supplement data on companies not covered in the annual or quarterly surveys; and used to compile the producer price index and physical production (or volume) indices;
(4) Free Zones Corporation: data on exports, imports, remunerations and employment for companies under the free-trade zone regime;
(5) DGSA and DGI databases, which are processed to obtain figures for exports, imports and taxes for products according to CNIC;
(6) The vector of final household consumption accounts, compiled from the 1993 and 1998 Living Standards Measurement Survey (NISC) and from the 1999 CBN National Survey of Household Incomes and Expenditure;
(7) The 1996 and 2001 urban economic censuses, which are the basis for the sampling frame and for the compilation of expansion factors;
(8) Municipal and industrial slaughterhouse statistics, Ministry of Agriculture and Forestry;
(9) CBN monthly economic indicators;
(10) Specific research and field visits to leading industrial companies.

Where data is available on output volumes and/or physical units, the gross output value in constant prices is obtained by extrapolating from the volume and/or quantity indices. Where no such data is available, the gross output value is obtained by deflation based on the corresponding price indices.

Mining
The annual mining sector report of the National Administration of Geological Resources (AdGeo) provides the data sources used to compile production accounts on activities and on the supply and use balances for these products.

Construction
The data used to calculate the construction of private residential and non residential buildings is obtained from the quarterly survey of private construction. The survey covers square metres of new construction, which are valued by price per square metre and classified according to their economic use. Annual figures are obtained by adding together the values from the four quarters. Public construction is calculated based on public sector construction data. A composite index is used to calculate public construction in constant prices. This index is calculated by weighting an index for construction material prices representative of public construction, and an index of remuneration for the same activity.

Electricity supply
Gross output values and intermediate consumption for this activity are obtained through the analysis and classification of accounting entries from financial statements. Gross output value comprises the value of sales, output for own consumption and the profit margin from sales of imported energy. To estimate values in constant prices, the prices and quantities (kWh) of consumption are classified by economic sector (residential, commercial, industrial, government, irrigation and pumping).

Capture, purification and distribution of drinking water
Drinking water supply and sewerage systems are the responsibility of the Nicaraguan Water and Sewerage Corporation (ENACAL, previously the Nicaraguan Water and Sewage Institute (INAA)). The gross output value is the value of sales. Gross output values and intermediate consumption figures for this activity are obtained through the analysis and classification of accounting entries in the financial statements provided by the Corporation. For values in constant prices, the prices and quantities (square metres) of consumption are classified by economic sector (household, industrial, commercial and government).

Wholesale and retail trade, repair of vehicles, and personal and household goods

The value of trade output is estimated based on the annual trade survey. The results of the survey of market outlets and gross margins, annexed to the 1997 annual trade survey, were used to distribute the trade margin between the various groups of products. The distribution margins for each product group were obtained from this survey and subsequently separated into transport and trade margins. This research provided a structure for trade margins, which was applied to the basic price for each demand component in each year.

Gross output values and intermediate consumption for the repair of vehicles and for personal and household goods are calculated based on the annual survey of services. Constant values are calculated from price or volume indices for the products, to which margins are applied. The sum of these comprises the gross output value of total trade. In addition, the vehicle stock provided by the national police was used to calculate constant values for the repair of motor vehicles.

Hotels and restaurants

The gross value of production and intermediate consumption in these sectors is calculated from the annual survey of services and reconciled with the data on tourism compiled by the Nicaraguan Tourism Institute (INTUR), which provides a breakdown of spending by foreign tourists in Nicaragua. The figures provided by INTUR (volume index) on the number of nights spent by national and foreign tourists and a rate of use index for service activities are used to establish constant values.

Communications

Current levels of production and demand for inputs in this sector are obtained from analysis and classification of the accounting entries in the financial statements. The gross value of production corresponds to the value of sales. In the case of imports and exports, data on trade with the rest of the world is also available in the balance of payments. Constant values are obtained by deflation of the transport and communications entries by the consumer price index. Depending on availability or reliability, a volume index of conventional telephone service may also be used.

Transport

Data provided by the Ministry of Transport and Infrastructure on the number of passengers transported annually and the corresponding tariff by route is used to calculate the gross value of production. Similarly, in the taxi subsector, figures are provided by a taxi cooperative on the number of passengers, average fares and cost structure and by the Ministry of Transport and Infrastructure on the number of licensed taxis. The 1997 annual trade survey yielded data on the distribution margins for each group of products, which were subsequently separated into transport and trade margins. This survey provided a structure for transport margins, which was applied each year to the base price of each demand component in order to obtain the level of production of the freight transportation sector. The consumer price index for the transportation sector is used to deflate current values.

Financial intermediation and auxiliary activities

The financial statements of each of the institutions in a given sector are used to prepare the production accounts of that sector. Total production comprises the fixed commissions charged by financial intermediaries and the implicit charges known as financial intermediation services indirectly measured(FISIM), which are calculated as the value of the asset income earned by financial intermediaries less interest payable, with the production assigned to a fictitious sector, which is one of the options recommended by the System.

The exchange rate variation is used as a deflator in order to establish constant values. In the case of deposit companies, the necessary indices are obtained from the movement of assets and liabilities. If the latter are denominated in the national currency, they are deflated by the consumer price index. Assets and liabilities denominated in foreign currency (but converted into córdobas) are divided by the current year's rate of exchange deflated by the producer price index (PPI) of the United States of America and expressed in córdobas of the base year using the exchange rate for that year. Total assets and liabilities at base year prices are divided by the base year value in order to obtain the volume index for income and expenditures, respectively.

Real estate and rental activities
Actual and estimated residential leases are calculated from the following data sources: 1993 and 1998 Living Standards Measurement Surveys, 1995 Seventh Population Census and 1995 Third Housing Census, 1999 Household Income and Expenditure Survey, and, since 1998, the quarterly survey of private construction. Data on non-residential rentals is obtained indirectly, in other words, from what is reported in production statements under this head by other economic sectors. Constant values are obtained by using construction price indices.

Private social and health services
The gross value of production and intermediate consumption is calculated from the annual survey of services. Additional data used to cross-check the value of production in this branch included the national health accounts of the Ministry of Health.

Other community, social and personal services
The gross value of production and intermediate consumption is estimated from the annual survey of services, from the financial statements of the lottery, from the Ministry of the Interior in the case of non-profit institutions serving households (NPISH) (for these institutions the gross value of production is equal to final consumption, as recommended by the System), from the 1993 and 1998 Living Standards Measurement Surveys and from the 1999 National Survey of Household Incomes and Expenditure. Variations in the consumer price index (CPI) of the corresponding year and/or the rate of population growth are used to estimate constant values.

Government
The data sources used to prepare the production accounts for the various sectors are: the national budget, with the budget implementation of expenditures for each institution presented by chapter, section and subsection; revenue by type of tax and collecting agency; details of transfers; the report on the implementation of the national budget submitted to the National Assembly; details of the financing of the deficit; implementation of the public investment programme; general balance and statement of results broken down by accounts and sub-accounts and notes appended to financial statements; and budget implementation of expenditures by type of taxes of the Municipality of Managua and other local governments.

The gross production of the central government was distributed among the following categories: public administration and defence, public education, public health services and services provided by associations, and recreational and other services. The calculation of the government at constant prices is done using the double deflation method recommended by the United Nations in the national accounts handbook at constant prices. This method consists in deflating intermediate consumption with price indices and extrapolating the value added with employment volume indices. The value added (remuneration at constant wages) is calculated by extrapolation of the figures recorded in the base year, using a labour index in which variations in the number of workers in each category (or "job sector") are weighted with the total share of the remuneration corresponding to this category in the base year.

Niger

Source

National accounts in the Niger are compiled by the National Accounts Division of the National Institute of Statistics (INS). National accounting in Niger is guided largely by the "Methodological Guide for National Accounts Compilation in Member States of the Sub-Saharan African Economic and Statistical Observatory (AFRISTAT)". This Guide states the recommendations of the 1993 System of National Accounts (1993 SNA) with respect to the AFRISTAT member States and advocates a harmonized approach among member States.

General

The most recent national accounts publication, entitled "2006 Preliminary Accounts", was published in February 2007. This publication included the final accounts for 2003 and 2004, the provisional accounts for 2005, and the preliminary accounts for 2006. The reporting period for national accounts is the calendar year and accounts are compiled as follows: the preliminary account for year N-1 is compiled in February of year N; that account is revised between June and August of year N and is treated as "provisional"; and the account for year N-2 is finalized during this revision and the GDP for year N is estimated. National accountants in Niger have been working for the past several years to implement SNA 1993 using the same methodology and data processing tools as are used by the member States of the West African Economic and Monetary Union (WAEMU).

Methodology:

Overview of GDP Compilation

National accountants in Niger use the production approach as the primary method of determining GDP, with some consideration given to aspects of the expenditure and income approaches. As a rule, GDP is based on production and is calculated at both current and 1987 prices. The methodology for calculating GDP varies according to industry group and the availability of data. There are anomalies, particularly in agriculture, where the determination of producer prices has a unique feature: for each product, the producer price is equal to the average wholesale price for the last three months of the year (in other words, the period just after the harvest, which is considered to be conducive to a more reliable measurement of producer prices). There are also anomalies in the livestock sector, in which, in the absence of an annual survey (birth rate, death rate, rate of slaughter, etc.), production and gross fixed capital formation are determined on the basis of a number of coefficients. Anomalies also apply to the informal sector, which is measured on the basis of both the 1995 informal sector survey and a number of industry-specific price and volume indicators.

Expenditure Approach

Final consumption by government agencies is measured by the value of non-merchandise services produced by the non merchandise branches of government agencies less the partial payments made by households for the provision of these services. Final household consumption is initially measured on the basis of the 1993 budget/consumption survey, factoring in the rural and urban population growth rates. The gross fixed capital formation of modern sector enterprises is calculated by using statistical and tax declarations. Research costs are considered part of the GFCF. The GFCF of financial institutions is determined on the basis of their accounting documents by calculating the variations in fixed assets appearing in the balances for years N and N-1. The GFCF for livestock products is determined by using the following formula: GFCF = 2/3 (births − infant mortality − slaughter + imports − exports) The GFCF of informal sector enterprises was measured for the first time during the 1987 survey of the informal sector. Since then, it has been tracked as the annual variation in the GDP of the informal sector. Measurement of household GFCF was initially done on the basis of the 1987 informal sector survey. Since then, it has been tracked in accordance with population growth (rural and urban) and changes in the "housing" entry in the Harmonized Consumer Price Index (HCPI). Variations in stocks of agricultural product stocks are most often determined by the balance shown when supply-use tables are compiled. Foreign trade data is extracted from the balance of payments calculated by the Central Bank of West African States (BCEAO).

Production Approach

For Agriculture, there are two seasons: the first lasting from November to March (irrigated farming) and the second from June to September (rain-fed farming). Production totals for the agricultural season N/N+1 are included in the account for year N. The major agricultural products are: millet, sorghum, rice, niebe beans, cassava, sweet potatoes, groundnut, onion and sugar cane. The net production as recorded in national accounts is arrived at by taking gross production as measured by the Ministry of Agriculture and Livestock and subtracting losses, estimates of which are also provided by the Ministry. The rates of loss were determined in a study of agricultural products done in the early 1980s. Rates differ from product to product, but are unchanged from year to year. Data on intermediate consumption levels is obtained from studies conducted by the National Accounts Service in 1990, which determined the amount and value of agricultural inputs (seeds, manure, light equipment and fertilizers). The intermediate consumption rate is currently between 8.5 and 11.6 per cent. The producer price is the average price, weighted by volume, observed in 16 markets during the months of October, November and December of each year. For products for which only consumer prices are available, recourse is had to the average marginal rate, which is arrived at on the basis of the prices of products tracked by the Market Information System (MIS) survey. Where no information on a product is available, the variation rate in consumer price indices or the average variation in the price of cereal products is used. Supply-use balances for the quantity and value of each product are calculated during the compilation of the final accounts.

The 2004 livestock census established new totals for each category of animal. The respective rates of increase were determined by a 1995 study of the Sahel countries. Since birth, mortality and death rates are known (1987 survey), the volume of production is calculated as follows: Production (P) = Births (B) – IM – 1/3 AM where IM = infant mortality = B x Infant mortality rate (IMR) AM = adult mortality = T x AMR B = total (T) x birth rate (BR) With regard to producer prices, there are three categories of livestock markets: – Livestock markets located in livestock farming areas where sellers are predominantly herders; – Wholesale markets located at the intersections of several livestock routes, usually in agricultural areas where sellers are small dealers along with a few herders; – Consumer markets, located near urban centres or border dispatch locations where nearly all sellers are livestock dealers. Wholesale prices are equated with producer prices. The average price for each type of animal is calculated by weighting the average price in each district in accordance with the number of animals sold or slaughtered. A survey conducted in 1990 determined the amount and value of intermediate livestock inputs. These consist mainly in dry stock feed, bran, vaccines and other phytosanitary and petroleum products, whose total value is estimated at 18 per cent of the value of production.

Forestry Baseline data for this sector is difficult to obtain and the information available is often of poor quality. Estimates of firewood production are based on annual consumption ratios per person as measured by environmental services (0.8 kg in rural areas, 0.65 kg in urban settings, per person, per year). Prices are provided by the Energy Project or based on consumer price trends. The volume of timber production varies with the demand from the informal construction industry. Prices are obtained from the "housing" entry in the Harmonized Consumer Price Index (HCPI). Intermediate consumption is estimated at 13.9 per cent of production. Fishing Tonnages and average prices per kg charged by fishermen are provided by the Division of Fisheries and Pisciculture. Where the price of fish is not available, producer prices are tracked in accordance with the average annual variation in consumer prices (source: HCPI). Intermediate consumption is estimated at 7.5 per cent of production.

The modern merchandise sector and the baseline documents are the statistical and tax declarations (DSF) and the simplified questionnaires the responses to which are processed automatically on an Excel spreadsheet. Estimates of "modern" sector accounts are based on a list of enterprises (in the absence of a directory) whose maintenance presents certain problems (establishment or closure of a business). To minimize the risk of error, the Service cross-checks data from the Tax Department (DGI) and the Chamber of Commerce and monitors announcements of the creation or dissolution of companies appearing in the daily newspaper "Le Sahel". Nevertheless, coverage of the modern sector remains incomplete. The National Accounts Service is therefore seeking from the Tax Department those documents which it does not already possess. Non-responses are then evaluated against trend indicators that are based on a sample of enterprises (by industry group) that responded in

years N-1 and N. The criterion used is production or turnover. Care is taken, however, to exclude outliers for each industry group.

Public administration services in the Niger, some Government agencies are funded by domestic resources and others from external resources. The domestically funded government sector includes central and local government agencies and the social security administration. Central government agency funding consists of the general budget, the investment budget (cash component), special treasury accounts, and various central government agencies. Expenditures and income are transferred from the general budget into agency accounts using a correspondence table. Three points should be noted: expenses are calculated based on payments made; principal and interest on foreign debt are disaggregated on the basis of information provided by the Public Debt Division; domestic debt is disaggregated according to a fixed distribution key (interest 40 per cent, principal 60 per cent). For the investment budget, categories such as intermediate consumption, wages, capital transfers, and transfers to government agencies (APU) are calculated and the balance used to determine the gross fixed capital formation (GFCF).

Special treasury accounts are mostly commercial. For each account registered with the Treasury, total expenditures and total income are used. Distribution keys based on previously obtained detailed information are then used to transfer the data into the national accounts. Other government agencies include public institutions with independent financial management but whose principal funding comes from the State. Local government agency accounts for regions, departments, communes and special territorial division (arrondissements) are compiled on the basis of statements of income and expenditure available from the Ministry of the Interior. There are two government social security agencies: the National Pension Fund, which is managed by the Treasury and has information on social contributions paid in and benefits; and the National Social Security Fund (CNSS), which makes available detailed account records. A distinction is made between reimbursable and non-reimbursable assistance provided to government agencies that receive financing from abroad. Reimbursable assistance consists almost exclusively of loans to finance development projects and loans from the International Monetary Fund (IMF).

Accounts are compiled using a distribution key devised in 2001 that distributes expenses among investment, operating expenses and staff costs. Non-reimbursable aid consists of grants in cash or in kind. This aid takes various forms: development project assistance, technical assistance, scholarships and fellowships, interest rate subsidies, food aid, military aid, etc. All of this is supplemented by the contribution of the Niger to development projects. As with reimbursable aid, distribution keys are used to input the available data into the national accounts. In spite of some gaps in price and volume data, GDP by industry group and by its uses is calculated in constant prices. The methodology used was introduced in 1990 by a United Nations regional adviser from the United Nations Economic Commission for Africa (ECA). The baseline year used is 1987, a year for which certain statistical data was available (input-output tables (TES), 1987 informal survey, survey of consumption of essential items in Niamey). For the production accounts in constant prices, the double deflation method is used where price and volume data are available (agriculture, livestock and fishing), and price or volume indicators are used in other cases.

Nigeria

Source
The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. Data under series 100 were received from the National Bureau of Statistics - Nigeria.

General
The official estimates together with methodological notes on sources and methods are published in "Gross Domestic Product of Nigeria". Another publication "National Accounts of Nigeria" with estimates dating back to 1958/59, was published in 1978. Input-output tables have been published for the year 1959/60 in "An Input-Output Analysis of the Nigerian Economy". When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. The estimates shown in the following tables are deemed to have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA).

Methodology:

Overview of GDP Compilation
Gross domestic product is estimated mainly through the production approach.

Expenditure Approach
The expenditure approach is used to estimate government final consumption expenditure, exports and imports of goods and services and buildings and other construction of gross fixed capital formation. This approach, in combination with the commodity-flow approach is used to estimate investment in machinery and equipment. Private final consumption expenditure, which includes increase in stocks, is estimated as a residual. Government consumption expenditure is estimated from the annual economic analysis of the accounts of the public authorities. Useful information on private consumption expenditure will become available when the urban consumer survey and the rural consumption inquiry for 1974/75 are completed. The estimates of gross fixed capital formation for machinery, transport and other equipment are based on foreign trade statistics supplemented by information on import duties. A mark-up for trade, transport and installation charges of 33.3 per cent and 10 per cent is added to the import values of machinery and transport equipment respectively. The values of small concrete buildings are based on the value of cement used and of mud-walled houses on the estimated population in need of such houses. For the oil sector, the estimates of gross capital formation are compiled from the returns obtained from the oil companies. Sources for other sectors include the accounts of the Nigerian Coal Corporation, the reports of the Nigerian Steel Development Authority, the Nigerian Railway Corporation and the Nigerian Shipping Line Ltd., and the accounts of the government. The main sources of information for exports and imports of goods and services are the balance of payments accounts.

Income Approach
Compensation of employees, operating surplus, and consumption of fixed capital are obtained as a residual by deducting net indirect taxes from the gross domestic product. For indirect taxes and subsidies, the annual government accounts are used.

Production Approach
The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate the value added of most industries. The income approach is used for producers of government services. Production estimates for 13 harvested agricultural crops are obtained from the national agriculture sample census in 1974/75 and the annual rural economic surveys. Estimates of output for green vegetables, tomatoes, oranges, bananas, sugar cane, coconut, pawpaw and pineapple are based on the average expenditure per household contained in the reports on inquiries into the income and expenditure patterns of lower

and middle income households supplemented by export data. The values are reduced by 50 per cent for trade and transport charges. Foreign trade statistics provide the information for all other crops, except cocoa and tobacco which is estimated from information supplied by the Nigerian Produce Marketing Company, and from manufacturing companies. For livestock and its products, estimates are based on such data as foreign trade statistics, number of animals slaughtered, number of cattle that are milked, Lagos retail prices, etc. Non-monetary activities are covered in the estimates. The output of timber is estimated from the data on logs exported or used locally. Data on the production of fish are obtained from the Federal Fisheries Department.

The annual reports of the Petroleum Division in the Federal Ministry of Mines and Power furnish information on production and f.o.b. values of crude oil and the quantity of gas sold. The same Ministry also furnishes data on production of metalliferious ores. This output is valued at f.o.b. prices. Information on the values of manufacturing output and intermediate consumption are obtained from the annual surveys of large establishments. Adjustment is made of value added by 20 per cent to cover small establishments. The estimates of electricity are based on annual reports of the concerned companies. The sources of information on water supply are the actual expenditure of the government bodies and annual accounts of water boards of corporations. Data for estimating value added in construction are obtained from accounts of public authorities and corporations government enterprises and the survey of large establishments engaged in mining, manufacturing and distributive activities. For smaller construction activities, sources such as the value of cement used, questionnaire and actual of approved expenditure of public authorities are used.

Trade is assumed to be 12.5 per cent of GDP in the base year 1958/59. For other years, value added is extrapolated by indexes. The benchmark value added of road transport is based on the number of commercial vehicles. Other years' estimates are made by projecting the 1958/59 figure by the estimated number of tractors and commercial vehicles and using the CPI of transport services for five urban centres. The value added of railways, harbours, water and air transports are estimated from annual reports of concerned enterprises. The sources of information for estimating the value added of government services are the accountant-general's reports and budget of the public authorities. For education, estimates are based on information obtained from the Federal Ministry of Education and the National Universities Commission for private institutions and on the number of teachers and an assumed average salary per teacher for other institutions. For private health institutions, the expenditure on personal emoluments is regarded as value added and assumed to grow at the same rate as for government institutions. The value added of other services, which includes the financial sector, is assumed to grow at an average annual rate of 13.8 per cent.

For the constant price estimates, price deflation is used for the manufacturing, construction, part of transport and services sectors. For agriculture, the production of crops is either revalued at 1962/63 prices or deflated by retail prices. Value added of mining, electricity, trade and transport relating to passenger-miles and ton-miles is extrapolated by appropriate indicators.

Norway

Source

The preparation of national accounts statistics in Norway is undertaken by Division of National Accounts at Statistics Norway, located in Oslo. The official annual estimates are published on the Internet (www.ssb.no), in "National Accounts" in two separate volumes: Production, Uses and Employment; Institutional Sector Accounts (latest for 1995-2002, since 2003 to be published every five years or so), as well as in the annual Statistical Yearbook. All together 36 tables containing annual national accounts estimates are available on the Internet, and also Supply and Use tables (presently for 2004) and Input-Output tables (1992-2002).

General

The latest estimates have been prepared in accordance with the concepts and definitions recommended in the System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

1993 SNA was adopted already when the first results from the main revision were released by summer 1995. Statistics Norway has published revised national accounts estimates in 2002, this time without any major definitional changes to the system. Latest main revision was undertaken in December 2006, including new treatment (allocation) of FISIM. Chain indices are used to measure volume growth (annual chaining), and the resulting chained constant prices data, 1995 base (2000 base used nationally), are not additive.

A complete methodological inventory on GDP compilation in current prices in the context of 1995 ESA has been submitted by Statistics Norway to Eurostat in several updated versions, the 2006 version being the latest following the previous 2004, 2001 and 1996 versions. The earliest one was made available in print by Statistics Norway (as Documents 96/5 and 96/6), while the latest 2006 version has been made available to users electronically by Eurostat on the Circa website. A shorter inventory on GDP compilation in constant prices has also been prepared and made available by Eurostat.

Methodology:

Overview of GDP Compilation

Approaches used to calculate gross domestic product (GDP) in the Norwegian National Accounts are multidimensional. The production approach is regarded as the main approach through the strong emphasis on industrial breakdown. The expenditure approach is also much used through the supporting use of the commodity-flow method. The income approach has played a minor, although now increasing, role. The product dimension is a very strong element in the Norwegian approach, due to the long presence of annual Supply and Use Tables (SUT) being integrated in the national accounts.

Expenditure Approach

The expenditure approach is used to estimate all components of gross domestic product by expenditure type. Changes in inventories, however, are primarily calculated as the difference between supply and other uses for each commodity, since structural business statistics so far have been less suitable for changes in inventories.

Government final consumption expenditure is mainly based on government accounts. Central government accounts and local government accounts are used as for output, also for fees. In a few cases, government purchases from non-government producers, recorded as government final consumption expenditure, mean that government output is lower than government consumption on particular products. From 2001, a new statistical system for the collection of information about the activity in local government (KOSTRA) has been implemented and utilized.

Household final consumption expenditure is estimated from household consumer surveys (HBS); retail trade statistics, and a third group consisting of output figures, selected indicators and the commodity-flow method. It is interplay between these three source elements, and since the 1995 revision more use than before has been made of HBS data in current estimations (taking into account averages for smoother time series).

For NPISH final consumption expenditure, mainly central government accounts and local government accounts are used (thus as indirect sources since grants or transfers to NPISHs are recorded here), while supplemented by HBS in particular for deducting fees from households.

Gross fixed capital formation has two main dimensions in terms of breakdowns, one by type of assets, and one by kind of activity (industries). The estimation of gross fixed capital formation is first directed at the use of industry-related sources, such as the SBS-based statistics, and the expenditure approach, while the commodity flow approach takes a substantive role in the next phases. Exports and imports of goods are based on external trade statistics.

Exports and imports of services were previously based on foreign exchange statistics from the Bank of Norway, maritime transport statistics, oil and gas activity statistics and tourist/travel statistics. An important new source to replace the foreign exchange statistics from 2005 is the UT-statistics, i.e. reporting of balance of payments data from non-financial enterprises through quarterly and annual surveys.

For the constant price estimates, double deflation and the commodity-flow approach are used within the framework of detailed annual supply and use tables for all expenditure components. Current values are deflated by appropriate price indices. Household final consumption expenditure is adjusted to reflect the change in the CPI for the product in question. This will lead to adjustments of the current price values for trade margins and the basic prices of household consumption. Exports and imports of goods are mainly base don unit value indices from the external trade statistics, to which a thorough price fluctuation analysis is carried out in order to determine price-homogeneous goods.

Income Approach

Compensation of employees is estimated mainly from structural business statistics, government accounts, and sometimes from an indicator-based approach using wages and employment data. Register of Wages and Salaries has also become a most useful source. The estimation of compensation of employees is closely linked to the estimation of employment. Mixed income is estimated from the accounting statistics of self-employed. Operating surplus is arrived at as a residual, sometimes though being evaluated to have repercussions back on output, intermediate consumption and thus value added in industries involved. Consumption of fixed capital is estimated by using the perpetual inventory method. Time series of gross investment at constant prices and parameters needed provide the basis for calculating consumption of fixed capital. Taxes and subsidies on production are estimated from government accounts.

Production Approach

The production approach is used to estimate value added of almost all industries. This is done within the framework of detailed supply and use tables and using the commodity-flow method. More emphasis has been taken in utilizing accounting data. With the structural business statistics – a main source now for the NA compilation according to the production approach – use is made of a complete set of statements from large enterprises to the tax authorities. For the other enterprises, sales figures and other essential accounting data have been obtained from annual accounts in the Norwegian Register of Company Accounts.

Agricultural production is estimated from data prepared by the Budgeting Committee for Agriculture. A similar but less comprehensive source is used for forestry. Sources for fishing are catch statistics, annual census data for fish farming and cost surveys. For mining and quarrying, most important are oil and gas activity statistics (census-type), which include crude oil and natural gas production in the North Sea. For manufacturing, the annual industrial statistics have been replaced by the enterprise-based Structural Business Statistics, but supplemented

also with connected establishment data. For electricity and water, sources are electricity statistics and local government accounts, respectively. The annual statistics of construction (SBS-based source from 1996) give information on the value of production, cost of materials and gross fixed capital formation.

The estimates for wholesale and retail trade are based on annual wholesale and retail statistics (SBS-based), while two sets of sample surveys on trade margins have also been useful. SBS data are now used also for hotels and restaurants, and for all parts of transport and communication. Summary accounts for financial institutions including insurance exist in the annual credit market statistics. The production of rental services is distributed among production of paid rent (market output) and imputed rent by owner-occupiers (production for own use). Housing statistics of various kinds, also HBS and quarterly surveys of actual rents are used for dwelling services. Business services are estimated from annual production statistics, now a SBS-type source. For government services, data are obtained from the local government accounts and central government accounts including social insurance administration, and the reporting system KOSTRA. Private services are partly estimated from SBS-based statistics, partly from other accounting statistics and other sources. In several instances, household budget surveys have been taken into account, used directly for paid services in households.

For the estimation of constant prices, double deflation and the commodity-flow approach are used within the framework of detailed annual supply and use tables. Output and intermediate consumption is deflated by appropriate price indices. Different kinds of price indices are used, such as producer price indices, consumer price indices, price indices for exports and imports, etc. In the production approach, for each of about 1000 products, three price indices are developed, one for output to the domestic market, one for output for exports and one for imports. These different price indices (at different valuations) are stored in the "Price Relative Catalogue", which is used to compare the various price indices at the detailed product level. Balancing is carried out after conversion of all flows to basic prices. Non-market output is deflated by input methods, but research into output measures is ongoing. Hedonic indices are used for lorries, tractors, washing machines, computers and new dwellings.

* Statistical discrepancy between Net lending in the financial account and Net lending in the capital account.

Occupied Palestinian Territory

Source

The compilation of national accounts data were obtained from a specialized department (National Accounts Department) at the Palestinian Central Bureau of Statistics (PCBS). PCBS was established in 1993 under the name of the Palestinian Bureau of Statistics. The concepts, definitions, sources of basic statistics and methodology for compilation were described in the revised time series report covering 1994-2000 data at current and constant prices.

General

Palestinian National Accounts were first created in 1994. The publication of national accounts occurred on annual basis until a revised time series covering 1994-2000 in constant and current prices was achieved. After this time series annual national accounts were compiled for the years 2001-2004, but according to the estimates of the establishment census 2004, it was necessary to revise the annual national accounts based on the results that showed undercoverage in the economic surveys data. Based on that fact, a revised time series has been issued for the years 2001-2005 for the annual national accounts at current and constant prices and by regions. Quarterly national accounts data were compiled during the year 2004 for the years 2000-2004; currently quarterly estimates for the national accounts are compiled and available within 50 days of the end of the quarter. The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). The official estimates and methodological notes on sources and methods are published on the world-wide-web at http://www.pcbs.org/statistics/econ.aspx.

Methodology:

Overview of GDP Compilation

The first estimates for National Accounts were compiled in 1994. Their cornerstone was the Establishments Census 1994, which constituted the sampling frame of the all economic surveys that took place for the first time in 1994. These surveys, included: industry; domestic trade; services (both market producers and non-profit institutions); and building and construction (contractors were the source data for the compilation of the national accounts). National accounts estimates were also substantially based on administrative records. Estimates for the years of 1995 and 1996 were prepared simultaneously after conducting field surveys using two separate questionnaires for both years. In 1996 the questionnaire was detailed, whereas in 1995 the questionnaire was abridged. The updating of the economic surveys of this period was based on the administrative records and a number of field visits. Technical advances, especially with respect to coverage and comprehensiveness, marked this stage. Supply and use tables were compiled for the National Accounts of 1997 and 1998. It was based on the Population, Housing, and Establishment Census 1997, which enabled a better level of coverage and comprehensiveness both in respect of the sampling method for economic surveys (establishments record) and the estimates of households' expenditure in accordance with the findings of the Population Census. Using Supply and Use Tables as a methodology to prepare and construct the National Accounts led to important adjustments to some data sources such as foreign trade and agricultural statistics. Additionally, better estimates of the informal sector were achieved at this stage. In addition to that, a complete set of deflators were available in order to compile the national accounts at constant prices for both the production and the expenditure approach.

Expenditure Approach

The estimates for the expenditure approach were compiled according to the compilation of the production approach in 1994; the sources of the data were surveys and administrative records. Household final consumption expenditure was derived from the Palestinian Expenditure and Consumption survey. Government final consumption expenditure was derived from the administrative records (budgets of the ministries). Exports and imports of goods and services are based on foreign trade statistics and balance of payments.

Income Approach

Direct information is available on the compensation of government employees. Indirect taxes are available from the records. Operating surplus is derived as a residual item.

Production Approach

The gross domestic product by type of economic activity is prepared at current and constant prices. The production approach is used to estimate the value added of the various industries. The value added for agriculture is obtained from the agricultural statistics and obtained by deducting the costs of all non-factor inputs from the gross value of production. Data available are for the quantities and prices. Economic surveys are compiled annually and cover the following activities: mining and manufacturing; construction; wholesale and retail trade; Services; and Transport. Data for the output and intermediate consumption are available for each survey. Hotels and restaurants data are based on hotels surveys which are conducted annually. For financial activities, the value added is derived from the accounting records of banking and other financial institutions. The value added of government is compiled based on the administrative records of the ministries and government abroad. Constant price data are compiled using the double deflation method; specifically, the constant price data is derived by deflating both the output and the intermediate consumption. Construction activity and government activities are deflated using special price indices based on the inputs of production used in construction, and the wages in the government.

Oman

Source

National accounts data are prepared by the Directorate General of Economic Statistics of the Ministry of National Economy of the Sultanate of Oman located in Muscat, Oman. The official national accounts estimates are published in the "Statistical Yearbook" publications. Each statistical yearbook contains national accounts estimates for the three prior years. The thirty-fifth (2007) and thirty-fourth (2006) edition of the "Statistical Yearbook" are available from the Ministry of National Economy website at http://www.moneoman.gov.om.

General

The Directorate General of Economic Statistics conducted a comprehensive review to update the preparation system of national accounts and others that were not previously prepared for their importance as an index used to measure economical and social development of the Sultanate. The Sultanate applies the new System of National Accounts (SNA) approved by the Economic and Social Council of UN in 1993 after presented by the Bureau of Statistics of the UN. Application of the system was in two stages; the first included the preparation of the national accounts series for the period 1980-1997 for production and income generation accounts according to the international recommendations. The results were published in the 1997 -Statistical Year Book.

The second stage started directly after the release of the updating results of the first stage. The expansion of surveys carried out has a significant impact in the preparation and construction of accounts. Together with this, direct data and methodologies were relied upon instead of the indirect methods previously used in some activities; whereas updating of methodologies for preparation of accounts of production and income generation for some economic activities was achieved. During this stage, data were classified and coded according to the classifications stated in the SNA. The work included the transference of some data collected based on commercial accounting concepts and available in database to SNA concepts. The Ministry resorted to IMF and UN and other experts for the revision and updating processes.

The current account and capital account were constructed in accordance to institutional sectors for 1998-2006, and then the preparation and construction of supply and use tables and the Integrated Economic Accounts (IEA). The updating of the national accounts system required that the MONE expands the periodic economical and social surveys to develop and improve the quality of the basic data needed for the preparation of these accounts, the result of which were used in preparation of national accounts at current and constant prices according to the new methodology for 1998-2007.

The difference in the GDP by the new methodology at current prices compared with the previous methodology was due to a number of reasons which include:

- The economic and social surveys conducted by the Ministry allowed collection of a more detailed data.
- Additional economic activities were covered in the new methodology.
- Updating the method of calculating the intermediate consumption in the new methodology according to the detailed data for some economic activities.
- Amending the methodology for preparing the value added at constant prices for most of the economic activities according to new detailed deflators and change of base year to be 2000 instead of 1988.
- Breaking up the economic activities into institutional sectors.

Constructed Accounts and Tables:
Accounts at the Sector Level:

- Production account; the balancing item is value added balance.
- Generation of income account; the balancing item is operating surplus balance.
- Allocation of primary income accounts; and ends with the balance of primary income.
- Secondary distribution of income account; the balancing item is disposable income balance.

- Redistribution of income in kind account; the balancing item is adjusted disposable income.
- Use of Income account and ends with the saving.
- Capital account; the balancing item is net lending/borrowing.

Accounts at the Overall Level:

- Zero account (Good and Service account) which displays the economy balance at the overall level.
- Integrated economic accounts which reflect the integrated accounts for all sectors including abroad sector.
- Supply and use table; which displays the disposable resources (domestic production + imports) and the disposal of these resources in detail at the economic activity level.

Methodology:

Expenditure Approach

Household Final Consumption: This is measured by the value of all the individual consumption goods and services acquired by resident households.

Government Final Consumption: It is based on the government accounts and it's calculated by taking total production minus sales of the government.

Gross Fixed Capital Formation: The Gross fixed Capital Formation represents the value of imports of machinery equipment, building and construction in addition to the intangible capital formation, which is an estimate of oil and gas survey and exploration services.

Export and Import of Goods and Services: These estimates were based on the foreign trade statistics of commodities and the estimates of the balance of payments prepared by the Central Bank of Oman.

Production Approach

Agriculture: Sources of data used in estimating Output include the annual survey of agricultural production for the main crops, some studies carried out by Ministry of Agriculture and Fisheries, and the periodic survey of agricultural products and livestock prices conducted by the Directorate General of Economic Statistics. The studies and researches carried by the Ministry of Agriculture and Fisheries are utilized for calculating intermediate consumption.

Fisheries: Estimates of the output were based on the periodic surveys of traditional fishermen conducted by the Ministry of Agriculture and Fisheries and also data of commercial fishing companies. As for intermediate consumption, some studies prepared by the Ministry of Agriculture and Fisheries were used in the estimation process.

Mining and Quarrying: Crude Petroleum Output estimates are obtained by multiplying production quantities by average monthly price of oil plus the value of crude petroleum sales to Oman Refineries and Petrochemicals Company (ORPC). The production includes estimated income of services generated by oil companies. The value added of this activity is estimated by subtracting the value of intermediate consumption (estimated on the basis of detailed data analysis of current expenditure of ORPC and other oil companies) from the value of output.

Services Incidental to Oil and Gas: Output represents the cost of drilling and exploration by the oil companies. The intermediate consumption is estimated on the basis of field surveys.

Mining of Non Ferrous Metal Ores: Estimates of value added are based on the analysis of balance sheets of the companies working in this field

Quarrying of Stone Sand & Clay: Quarrying of stone, sand and clay production estimates for this activity are based

on the periodic survey of quantities conducted by Ministry of Commerce and Industry.

Natural Gas: The output of the natural gas activity represents the value of the government gas consumed. The intermediate consumption is computed based on the cost of operation of the Government Gas System. It also constitutes the production of the upstream project of the government owned OLNG , which is the sales of gas to Oman Liquefied Natural Gas Company . The intermediate consumption was calculated according to the costs of production operations.

Manufacturing of Refined Petroleum Products: The value added of this industry was estimated based on the analysis of the Oman Refineries and Petrochemicals Company (ORPC) budget.

Other Manufacturing: Results of economic surveys carried out by the Directorate General of Economic Statistics and the Industrial Survey conducted by Ministry of Commerce and Industry were used in the estimates of this activity.

Manufacturing of basic chemicals: Value added based on the analysis of the budget of the companies working in this field.

Electricity: the value added of this activity is represented by the analysis of the budget of the companies operating in the area of production, transport and distribution of electricity.

Water: this activity is divided into public (government) production and private production. Government production represents total government revenues from selling water. Private production equals to the value of the water consumed by households that do not use government water.

Construction: The construction activity includes all the residential and non-residential buildings construction operations, construction of roads, electricity and water projects and land preparation etc. Estimates of this activity were based on the annual economic survey of the construction carried out by the Directorate-General for economic statistics.

Maintenance of Vehicles: Output represents the maintenance requirements of the vehicles for the different economic activities, in addition to the individual's expenditure in this field.

Wholesale and Retail Trade: The output of this activity was estimated based on the trade margins for the locally produced commodities, by type of commodity, and the total trade margin for imports, by type of commodity. Intermediate consumption is obtained from the results of economic surveys of this activity.

Repair of Personal and Household Goods: Output represents the households' expenditure on repairing personal and household goods.

Hotels and Restaurants: Estimates were based on the annual survey of hotels and restaurants carried out by the Directorate General of Economic Statistics.

Transport: Output estimates are based on the transport margin for the total supply of goods (i.e., domestic production plus imports) in addition to the analysis of financial statements of some companies working in the transport field as well as the results of the annual economic survey.

Posts, Telegraphs and Telephones: Estimates were based on the accounts of the Ministry of Transport and Telecommunication and on the final accounts of the Oman Telecommunications Company (Omantel) and Omani Qatari Telecommunications Company (Nawras).

Financial Intermediation: Estimates were based on the annual surveys of Banks, Insurance companies, other intermediaries and the analysis of final accounts of Muscat Securities Market (MSM) and the Central Bank of

Oman (CBO).

Real Estate and Business Activities: Several secondary activities come under this activity. In general, government, oil companies' employment data, the average wage, number of house by type and average rent were used to calculate the details of this activity, in addition to the analysis of economic surveys data.

Producers of Government Services: The value added of this activity represents salaries, wages and depreciation. Estimates were based on the State's final accounts. The financial accounts were re-classified into economic accounts according to the New System of National Accounts (SNA 93) in addition to the distribution of government expenditure to (14) sectors and the re-valuation of depreciation by using the Perpetual Inventory Method.

Education: Education is divided into public education and private education. Private education output represents the revenue of private schools & language schools, Private Colleges, institutes and driving schools. These estimates were based on the results of the annual economic survey conducted by the Directorate General of Economic Statistics and other quantitative statistics such as, number of students, schools and institutes. Output of public education represents salaries and wages of the government education sector, plus depreciation, and intermediate consumption.

Health: This activity is also divided into public and private Health. Private health output represents the income of all private clinics and hospitals. Estimates were based on the results of the annual economic survey. Output of public health represents salaries and wages of the health sector in the government budget, plus depreciation, and the intermediate consumption.

Other Community, Social & Personal Services: This activity is divided into public and private. The public aspect represents salaries and wages of the housing sector and the entertainment, cultural and sport sector, plus depreciation, and the intermediate consumption. The private aspect however, was estimated by using economic indicators from studies conducted by the Ministry of National Economy.

Private Households with Employed Persons: Numbers of housemaids, servants, cooks and chauffeurs, in addition to the average annual salary were used to estimate the value of output.

[a] Includes FISIM while FISIM is excluded in industries tables.
[b] At producer's prices, excludes Financial intermediation services indirectly measured (FISIM) while FISIM is included in industries' tables.
[c] Excludes Financial intermediation services indirectly measured (FISIM), but FISIM included in industry data.
[d] Data for this year refers to preliminary data.
[e] Data for this year(s) have not been revised.
[f] Includes Gross Mixed Income. Includes Taxes less Subsidies on products. Refers to Net Value.

Pakistan

Source

Reply to the United Nations national accounts questionnaire from the Federal Bureau of Statistics, Statistics Division of the Ministry of Finance, Economic Affairs & Statistics, Islamabad. National accounts estimates are also published in the "Monthly Bulletin of Statistics" and "Statistical Pocket Book of Pakistan", "Pakistan Statistical Yearbook", "Economic Survey", and "Annual Report of the State Bank of Pakistan", and also released on FBS website, www.statpak.gov.pk.

General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). The official estimates and methodological notes on sources and methods are published in a series of reports entitled "National Accounts of Pakistan". Estimates relate to fiscal year beginning 1 July. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Rebasing of the National Accounts estimates from 1980-81 to 1999-2000 gained prime importance as Pakistan delayed the re-basing of the national accounts for two decades. As such, many structural changes which took place since 1980-81 until 1999-2000 on the production and consumption structure of the economy were not captured in the country's national accounts. A number of economic areas remained either uncovered or under-reported and accordingly under-estimated the size of the national income. Taking cognizance of facts narrative above, the Annual Plan Coordination Committee (APCC) in its meeting in 1997 recommended to re-base the national accounts of Pakistan to make the GDP and investment figures more realistic. The journey of the re-basing exercises that began in 1997 culminated in July 2003. During the period, various technical committees were set up, a number of studies were undertaken and reviewed by experts inside and outside the country. Accordingly, the size of the overall GDP in 1999-2000 increased by 19.5 percent, agriculture by 18.5 percent, industries by 18.0 percent, and services by 20.8 percent over the old base. Per capita income in US dollar term was estimated at $526 for the year 1999-2000 compared to $441 according to the old base. Similarly, fixed investment showed an improvement of 34.3 percent in 1999-2000 mainly due to improved coverage.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. This approach, in combination with the commodity-flow approach is used to estimate gross capital formation. Government consumption expenditure is estimated by analysing the budgets of the government bodies with an element of estimation made for the local government bodies for which all the budgets are difficult to obtain. The basic information used in estimating increase in stocks is received from the Planning Commission. The estimates of gross fixed capital formation are classified by economic sectors. Benchmark estimates of agriculture are derived from 1980 Agriculture Census adjusted for 1980-81 and non-monetized investment are based on survey results conducted by FBS. Investment in the mining and quarrying sector is estimated on the basis of data obtained from annual censuses of mining industries and from concerned source agencies. For large-scale manufacturing, investment estimates are based on annual sample surveys while the small industries surveys in 1976-77, 1983-84, 1987-88, and now 1996-97 provided data for investment in small industries. Investment in

machinery and equipment of the agricultural sectors is estimated by the commodity-flow method. For the service sector, estimates are prepared from trade and domestic production data, annual budgets and annual questionnaires. Estimates of private residential construction are based on the rural construction survey, census reports, population growth and number of persons per household. Capital expenditure for the government bodies are based on the classification of their budgets. The estimates of exports of goods and services are obtained from the trade statistics of the FBS and the balance of payments statistics. For constant price estimates, all items of GDP by expenditure type are deflated by appropriate price indexes while gross fixed capital formation is deflated by sectoral deflators.

Income Approach

Domestic factor incomes consisting of compensation of employees and operating surplus, is obtained as a residual, i.e., after subtracting depreciation and net indirect taxes from gross domestic product. For depreciation, a flat rate is applied for the different sectors, 5 per cent for agriculture, mining and quarrying, small-scale manufacturing, public administration and defence and other private services, 10 per cent for large-scale manufacturing, 2.5 per cent for construction, 2 per cent for trade and 20 per cent for ownership of dwellings in the rural areas and 25 per cent in the urban areas. Data of indirect taxes and subsidies are derived from budgets of the government bodies, together with those collected by the Central Board of Revenue.

Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate value added in agriculture, mining and quarrying, manufacturing and electricity. The income approach is used for most of the remaining sectors. Production data of major agricultural crops are obtained from the Ministry of Agriculture. Corresponding harvest prices are obtained from the Provincial Directorates of Land Records. Minor crops harvest prices are taken at 80 per cent of the wholesale prices. Data on livestock products are obtained from the Department of Agricultural Marketing and Grading. The current price estimates are derived indirectly by applying the wholesale price index to the constant price estimates. Production and price data of forestry/fishing are obtained from concerned departments.

The Natural Resources Division and the Provincial Mineral Development Department provide production and price data for the mining sector. Gross value of output is obtained by multiplying the output of each mineral by pit-head or well-head prices in the benchmark year while annual output and index of wholesale prices are used for the current estimates. Value added at constant factor cost thus obtained are adjusted by wholesale price index for manufacturing to arrive at current estimates. For small-scale manufacturing, benchmark 1980-81 was computed on the basis of survey reports on SHMI for 1976-77 and 1983-84 and employment data from 1981 Population Census and Labour Force Surveys 1982-83 and 1984-85. The estimates for electricity and gas are based on data furnished by concerned companies while the estimates of water are included in public administration and defence sector. For construction estimates are based on gross fixed capital formation data in construction activity collected on annual basis by FBS, and its value added coefficients obtained from concerned construction agencies/companies.

The value added of the trade sector is measured by net trade margins earned by traders on various types of products entering into wholesale and retail trade. Trade margins are derived from distributive Trade Survey 1983-84. For the transport sector, estimates are based on data supplied by concerned enterprises and FBS surveys on mechanized and non-mechanized road transport. For the financial sector, value added is based on data provided by the State Bank of Pakistan and various financial institutions. Estimates of ownership of dwellings are based on Housing Census 1980, HED Survey 1973 and Construction Survey 1986. For government services, the budgets of the government bodies are used. For private services, the number of persons engaged in the different occupations is obtained from the 1981 Population Census and extrapolated by the intercensal growth rate in the working force of this sector. Price deflation is used for forestry and fishing, electricity and gas, transport, financial and community services. For mining, the annual output of each mineral is multiplied by the base year pit-head and well-head prices. Value added of the trade sector is obtained from the distribution of agricultural

produce, manufactured and imported goods. Value added of manufacturing, construction and ownership of dwellings is extrapolated by quantum indexes.

Panama

Source

The preparation of national accounts statistics in Panama is undertaken by the Direccion de Estadistica y Censos Panama. Official estimates are published annually, from 1960 in "Estadistica Panamena, Serie C, Ingreso Nacional" and from 1976 in the bulletin "Situacion Economica". The latter publication also contains the most detailed description of the sources and methods used for the national accounts estimation. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

General

The latest estimates shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previous estimates were prepared in accordance with the concepts and definitions of the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure as well as imports and exports of goods and services. The commodity-flow approach is used to estimate private final consumption expenditure and, to a large extent, gross capital formation. Data on government consumption expenditure are obtained from official documents and directly from the concerned agencies. Estimates of private consumption expenditure are based on data on locally produced and imported consumer goods. The gross value of construction is obtained by adding the cost of inputs of building materials to the estimated value added of the industry. Factor and non-factor services rendered by residents of Panama to the Former Canal Zone and to the Colon Free Zone are treated uniformly as non-factor services to the rest of the world. These services are, therefore, included in exports of goods and services.

Constant prices are estimated by a combined use of extrapolation and price indexes. For government consumption expenditure, compensation of employees is extrapolated by the number of persons employed, whereas purchases of goods and services are deflated by a combination of price indexes. For private consumption expenditure, base-year estimates are extrapolated by means of indexes which refer to consumption at both current and constant prices. The final estimates are adjusted for the discrepancy between total demand and total supply. Current values of gross fixed capital formation are deflated by a price index for inputs in the case of buildings and other construction. The current value of transport equipment and machinery and equipment are extrapolated by a volume index obtained by deflating current values by an index based on the unit export value of machinery in supplier countries. Various price indexes are used for price deflation of exports and imports of goods and services.

Income Approach

Estimates of compensation of employees are based on data on average wages, and the percentage distribution of employees obtained from household surveys. Yearly estimates of salaries earned in the public and private sectors, employers' contribution to social security schemes and an estimate of the incomes of self-employed workers is added to this information. Operating surplus is compiled from various items, such as property income, saving and direct taxes. The estimates on consumption of fixed capital, which exclude depreciation of government fixed capital, are based on accounting data of the private enterprises, obtained through direct surveys, and financial information of all autonomous and semi-autonomous entities included in the public sector. Estimates of indirect

taxes are based on data from public finance, and on revenue figures from central government, municipalities and the Panamanian Institute of Tourism.

Production Approach

For the agriculture, forestry and fishing sector, value added is obtained by deducting inputs from gross value of production. Sources used to estimate agricultural production include the census of agriculture, agricultural surveys and, in the case of export products, external trade statistics. Price data are obtained from the current statistics on prices received by the agricultural producers. Value added in forestry is derived from a benchmark estimate of sawn wood produced, the number of persons occupied and the ratio of output to employment, which is obtained from periodical industrial inquiries. In the case of fishing, estimates are based on fish landings in the Gulf of Panama, as published in "Estadistica Panamena" and on the number of persons engaged in fishing, which is obtained from the latest population census.

Value added of manufacturing is estimated by extrapolating the benchmark estimate by an indicator based on the gross value of production by type of industrial activity. A similar approach is used for the electricity, gas and water sector, as well as the construction and the trade sectors. For the trade sector the indicator used is based on the current prices of products which are marketed through wholesale and retail trade. For transport, value added is estimated on the basis of the payments to factor of production. Value added for ownership of dwellings is obtained by aggregating estimates for different geographical areas of the country. For business services value added is estimated by utilizing an indicator of patent registrations in force for operating business at the end of each year. Financial reports relating to factor payments from central government, other government authorities and municipalities, form the data basis for estimates of public administration.

A similar approach is applied for other public services, whereas for other private services value added is first estimated at constant prices and then inflated by price indices to arrive at value added at current prices. For the estimation of constant prices in the agricultural sector, the current quantities are valued at base year prices. Base year estimates for the manufacturing sector, are extrapolated by various indexes such as indexes of input quantities and quantum indexes of output. For construction, value added is extrapolated by a quantity index of inputs. For electricity, trade and transport value added is extrapolated by quantity indicators of output.

For restaurants and hotels the indicators are based on tourist expenditure in Panama and on food and beverage quantities. For banks, value added is extrapolated using the balance of loans and deposits at the end of each year. For ownership of dwellings in urban areas, the construction of new dwellings is used as indicator, and for the rural areas the base year estimate is extrapolated by an index of rural population growth. The value added of government services is extrapolated by an index of number of government employees. For other private services as well value added is extrapolated using various quantity indicators.

Source

Reply to the United Nations national accounts questionnaire from the National Statistical Office (formerly Bureau of Statistics), Port Moresby. The official estimates are published in "Gross Domestic Product and Expenditure".

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previously, the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). A detailed description of the sources and methods used for the national accounts estimation is found in "National Accounts Statistics". When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach. However, the commodity-flow approach is used for checking purposes in the case of a few items included under private consumption expenditure. The estimates of government consumption expenditure are based on budget papers, annual reports of the commissioner for local government, financial statements of provincial government and Australian budget papers. The market component of household consumption expenditure is estimated mainly from the results of the retail sales and selected services survey. Estimates for items not covered by this survey are obtained from sources such as budget papers, the population census, various surveys of urban markets and village industry and taxation data. For some selected items, the estimates are checked and supplemented by data from international trade statistics using the commodity-flow approach. The non-market component of household consumption consists of food and firewood for own consumption and services of owner-occupied dwellings. Estimates of food produced for own consumption are calculated by using data from the Rural Industrial Bulletin and the estimated consumption per head of population. The annual quantity of firewood used per family is multiplied by average price and the number of families gathering firewood for own use.

Construction and maintenance of housing is estimated by multiplying population data by the time spent and the minimum wage rate. Estimates of increase in stocks are based mainly on the Taxation Statistics Bulletin. For gross fixed capital formation by private industries, the principal source of information is the capital expenditure survey and for the public industries, the annual reports of the public enterprises. Exports and imports of goods and services are estimated mainly from the international trade statistics. For the constant price estimates of parts of government expenditure, private expenditure, gross fixed capital formation, increase in stocks and exports of merchandise, the current quantities are revalued at base-year prices. Regarding the market component of private consumption expenditure, building and construction, government expenditure on goods and services and imports of merchandise, the current values are deflated by appropriate price indexes.

Income Approach

Estimates of compensation of employees are based on taxation statistics, statistics of religious organizations and the Labour Information Bulletin. Adjustments are made for wages and salaries not covered by the above sources.

Imputed wages referring to work provided to government and mission authorities are shown separately. Estimates of operating surplus for the market component are based mainly on taxation returns with some adjustments made to cover imputed bank service charge and to include producers not required to submit returns. For owner-occupied dwellings, operating surplus is calculated from information contained in the Building Statistics Bulletin. Consumption of fixed capital is estimated based on taxation data supplemented by annual reports for producers not covered. The Papua New Guinea Budget papers and the annual reports of the Commissioner for Local Government provide all the information needed to estimate indirect taxes and subsidies.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e., producers' values. The income approach is used to estimate value added of most industries. Value added is defined as the sum of compensation of employees, operating surplus, consumption of fixed capital and net indirect taxes. The principal source is the income tax statistics, supplemented by annual reports of public and private enterprises. The reporting unit in these statistics is the enterprise (legal entity) rather than the establishment. For the major activities such as mining and quarrying, electricity, gas and water, and communication, in which cases almost the whole production is concentrated in a few enterprise units, the establishment type data are used. In cases where surveys data are used, adjustments and supplementary data are taken into account to cover activities not included. For the non-marketed production and contributions of free and partially paid labour, estimates are available separately as subdivisions of the relevant items as the amounts involved are quite substantial. As mentioned above, estimates of GDP by kind of economic activity are arrived at by subdividing the cost-structure components of total GDP into the various kinds of activity.

Compensation of employees is classified in accordance with the industry information on individuals' tax returns. If an individual has more than one source of income, he is allocated to the industry category corresponding to his major source of income and all of his income is classed to that category. Data on operating surplus of private enterprises are classified on the basis of information given in the company tax statistics and in the statistics of individuals' income other than wages and salaries, while the industry categories of the operating surplus of public enterprises are determined by the nature of their productive activities. For industry allocation of consumption of fixed capital, the taxation data supplemented by other information in respect of producers not covered by the taxation statistics provide the basis. In the case of indirect taxes and subsidies, the industry allocation is made on the basis of the nature of indirect taxes and subsidies. GDP by kind of economic activity at constant prices is not estimated.

Paraguay

Source

The preparation of national accounts statistics in Paraguay is undertaken by the Departamento de Estudios Economicos of the Banco Central del Paraguay, Asuncion. The official estimates are published by the Department in "Cuentas Nacionales".

General

The estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1993 (1993 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. The commodity-flow approach is used for the estimation of gross fixed capital formation. Private final consumption expenditure is arrived at as a residual. The information needed to estimate government consumption expenditure is obtained from the Ministerio de Hacienda, which controls the budget of the public sector institutions. Increase in stock is estimated for livestock only. It is assumed to be the annual increase of the cattle production minus the number of cattle slaughtered. Gross fixed capital formation is estimated on the basis of import statistics for machinery, equipment, transport and communication. Estimates of the domestic production of these items as well as the gross value of production in the construction sector are also included. Exports and imports of goods and services are estimated on the basis of information furnished by the Division de Balanza de Pagos of the Banco Central. For the constant price estimates, the only information available is that the wholesale price index is used as a deflator.

Income Approach

Compensation of employees is estimated by combining the information on the number of persons employed, by economic sectors and the average wages paid in each productive sector. Depreciation is estimated on the basis of the average lifetime of each type of capital good established in the respective depreciation tables. Information on indirect taxes and subsidies are supplied by the Ministerio de Hacienda. Operating surplus is obtained as a residual.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e., producers' values. The production approach is used to estimate the value added of most industries. The income approach is used to estimate the value added of public administration and defence, part of transport and communication, and part of other private services. The gross output of the trade sector is based on the commodity-flow appraoch, applying a fixed percentage for value added. The value of agricultural production is obtained by multiplying quantities by prices. Information on prices and on most quantities are obtained from Ministerio de Agricultura y Ganaderia. Remaining quantities are estimated through the use of indirect indicators such as the rate of population growth. The value of livestock production is estimated by type of livestock. Slaughtering is estimated on the basis of information provided by the Direccion de Impuestos and the meat-processing industries while stocks of cattle are based on the 1956 agricultural census. Inputs for the agricultural section is assumed to be a certain

percentage of the gross value of production.

The production of mining and quarrying is estimated on the basis of the industrial production coefficients of lime and cement. Information on the manufacturing sector is obtained from the surveys of the Banco Central, and the 1955 and 1963 industrial censuses. The value added of each industrial group is determined on the basis of coefficients from the 1963 industrial census applied to the gross production values. The value added of electricity and water is mainly based on information from the concerned enterprises. For construction, the source used is the production index for construction materials. This index is compared with permits granted by the municipalities expressed in quantitative measures, multiplied by the base year value and inflated by the implicit price index of construction materials.

Value added of the trade sector is assumed to be 30 per cent of the values of locally manufactured goods, imported goods and agricultural products net of farm consumption. For motor transport, the number of vehicles by category is multiplied by the number of days worked and the gross income earned in the base year. The resulting amounts are then multiplied by value added coefficients for each category of vehicle. Non-mechanical transport is calculated on the basis of the index of agricultural production transported in rural areas by carts. For ownership of dwellings, the estimates are prepared on the basis of the number of dwellings by type of construction materials used. Value added is estimated by multiplying the paid and imputed rents by the number of dwellings. The value added of public administration and defence is estimated as the total compensation paid to government employees based on information furnished by the Presupuesto General de la Nacion. The value of public education is determined directly from the Presupuesto General de Gastos de la Nacion while that of private education is estimated at constant prices by multiplying the number of students enrolled by the annual education costs plus registration fees minus 20 per cent for intermediate consumption.

For health, information is obtained directly from the public health services and social security services and from the Ministerio de Salud Publica y Bienestar Social for the private sector. Estimates for domestic services are obtained by multiplying actual annual wages by employment figures which are assumed to increase at a rate of 3.3 per cent in the urban area and 2.6 per cent in the rural area. For other services, benchmark estimates, based on the 1963 economic census, are projected by a specially constructed growth rate. For the constant price estimates, double deflation is used for the agricultural sector. The current quantities of mining and manufacturing are revalued at baseyear prices. Value added of construction, transport and financial sectors is extrapolated by using quantity indicators. For electricity, gas and water, trade and services sectors, value added is deflated by using appropriate price indexes.

Peru

Source

The National Directorate of National Accounts in Lima, which is part of the National Statistics and Information Institute of Peru ('Instituto Nacional de Estadísticas e Informática'), is responsible for preparing the annual statistics presented in the country's national accounts. Official estimates are published quarterly and annually and included in the National Statistics Compendium ('Compendio Estadístico Nacional). They are also posted on the Internet (www.inei.gob.pe). The concepts, definitions, sources of basic statistics and methods of estimation used are described in detail in the publications corresponding to each benchmark year: those for 1979 were published in March 1985; and for 1994, a methodological collection was published in July 2000. The quarterly and annual publications also include a chapter on the methodology and sources of information used to calculate the national accounts.

General

The most recent estimates include the following tables that have been prepared in accordance with the concepts and definitions of the System of National Accounts, 1993 (1993 SNA). In the past, estimates were made in accordance with the United Nations System of National Accounts, 1968 (1968 SNA). Input-output tables were published for the years 1979, 1981, 1982, 1983, 1984, 1985, 1986, 1987, 1988, 1989, 1990 and 1991. The input-output table for 1994 was published in July 2000 using the United Nations System of National Accounts, 1993 (1993 SNA). Any estimates that, for conceptual or statistical reasons, diverge from the definitions and classifications recommended in the System of National Accounts are explained in a footnote at the end of each table.

On 1 February 1985, a new monetary unit, the inti, which was equivalent to 1,000 soles, was introduced. The inti in turn was replaced on 1 July 1991 with the nuevo sol, which was equivalent to one million intis.

Methodology:

Overview of GDP Compilation

GDP is estimated primarily on the basis of production and expenditure calculations. The input-output tables are not prepared annually: separate estimates are calculated for each variable or economic activity, and then an aggregate balance is calculated for the economy.

Expenditure Approach

Estimates of the Government's final consumption expenditures are made on the basis of the production accounts, which are in turn calculated on the basis of the administrative records of the institutions that make up the Government (official budget expenditures less income obtained from the sale of goods and services). Estimates of constant prices for the Government's final consumption expenditures are based on the deflation of intermediate consumption, wages and fixed-capital consumption.

Values of private consumption expenditures on goods and services are mainly obtained by the product flow method and from the national household surveys. Data sources include production statistics for agriculture, manufacturing, electric power, water supply and foreign trade, by product, as well as statistical records on vehicle registrations and the communications sector. The national household surveys also provide information on products at current purchaser prices. The consumer price index is used to obtain current value data.

Own-account consumption (imputed rents for housing) is valued at producer prices in the case of owner-occupied housing. In the case of private expenditures on services, estimates are principally based on the statistics obtained from the national household surveys and the pertinent economic activities. In the case of private consumption expenditure, the current values provided by the national household surveys are deflated using appropriate price

indices (consumer price indices), and the internal demand method is used to calculate the estimates for non-food products.

Data on inventory changes are based on regular annual surveys, from which the trends for this variable are determined. The data are reconciled with the values obtained by inflating constant values. Constant values are determined by the difference between supply and demand and by deflating current values of any other reference data obtained from the surveys.
Gross fixed capital formation (GFCF) is determined on the basis of the value of domestic production plus imports (the relevant percentage on the basis of customs information is applied) less exports and is adjusted to include transportation costs, trade margins, etc.

In the case of the construction sector, the gross value of production for the individual branch is calculated on the basis of cement sales, the physical progress of public works undertaken by the Ministry of Transport, and rural population growth figures. Own-account construction of dwellings and buildings is included.

GFCF at constant prices is calculated by using a production and foreign trade index to extrapolate constant values.
The estimates of imports and exports of goods and services are based on foreign trade and balance-of-payments statistics. The constant values of imports and exports are obtained by using a foreign trade index to deflate current values.

Income Approach

Estimates of wages are calculated using data from the annual economic surveys and information provided directly by enterprises. Information on the following sectors is also directly available: Government, banking, insurance, pension funds, electricity and water supply. The gross operating surplus is calculated in the same way as a residual balance. No differentiation is made between the business surplus and the household surplus (mixed income). Estimates of stock depreciation are obtained from accounting information in the annual economic surveys and administrative records. Figures for taxes on products and other taxes on production and imports are obtained directly from Government records.

Production Approach

GDP by type of economic activity is calculated on the basis of producer values. Using production estimates, it is possible to make reasonably accurate estimates of the value added in all industries. In the case of public administration, national defence and non-market production activities, output is calculated on the basis of costs incurred.

The value added of agriculture is obtained by deducting intermediate consumption, including a figure imputed for the sector's own consumption, from the gross value of production. The calculations are based on the results of the agricultural censuses and in non-census years on the statistics for production volumes and prices obtained from the regular monthly and annual surveys conducted by the Ministry of Agriculture. Constant values are determined by applying the prices of the benchmark year.

In the case of fisheries (extractive and processed), mining (extractive and processed), manufacturing, construction, electricity, gas and water and other service sectors, value added is calculated by deducting intermediate consumption from the gross value of production. The estimates are based on the information obtained from the economic censuses and from the monthly and annual accounts reported in the years between censuses. Constant values are determined by extrapolating the values for the benchmark year.

In the case of financial institutions, the value added is derived from the financial statements of banking and other financial institutions, insurance companies and private pension funds. Estimates at constant prices for financial and insurance entities are obtained through a double deflation process, whereby the price index is applied to production and intermediate consumption, the value added being the difference. In the case of private pension funds, value added is extrapolated using a quantum indicator for production; intermediate consumption is

determined by deflation using a price index, and value added is calculated as the difference between the gross value of production and intermediate consumption.

The value added of the public sector as a whole is obtained by aggregating the value added of the various institutions that make up the Government as a whole, in other words, by aggregating the production costs obtained from their executed budgets. The estimates of constant prices used in the calculation of the Government's value added are based on the deflation of wages and fixed-capital consumption.

Philippines

Source

Reply to the United Nations national accounts questionnaire from the National Statistical Coordination Board (NSCB), Manila.

General

1. The National Statistical Coordination Board (NSCB) is tasked, among others, with the development, compilation and maintenance of the Philippine System of National Accounts (PSNA). The NSCB was created in 1987 as the highest policy-making and coordinating body on statistical matters by virtue of Executive Order (EO) 121, "Reorganizing and Strengthening the Philippine Statistical System (PSS) and for Other Purposes."

2. The current PSNA follows the prescribed statistical standards and concepts of the 1968 United Nations System of National Accounts (UNSNA) and to a limited extent, the 1993 SNA. It also applies the following standard classification systems: the Philippine Standard Industrial Classification (PSIC), based on the International Standard Industry Classification (ISIC) Rev.3 for all economic activities in the country; the Philippine Standard Commodity Classification (PSCC), based on the Standard International Trade Commodity (SITC) Rev.3; and the Philippine Central Product Classification (PCPC), based on the United Nations' Central Product Classification (UN-CPC) Version 1.1 for the detailed classification of products and external and domestic commodities that enter the Philippine trade.

The official estimates of the national accounts are published on a quarterly and annual basis in "the National Accounts of the Philippines" with a time lag of two months after the reference quarter for the 1st to 3rd quarter estimates and one month after the reference quarter for the 4th quarter estimates. The public is duly informed of the schedule of releases of the national accounts and its related accounts for the current year through the Advance Release Calendar (ARC) which is uploaded on the NSCB website (http://www.nscb.gov.ph/sna/schedule.asp) at the beginning of the year.

3. The quarterly PSNA compiles the GDP using two approaches, the production approach or by industrial origin, and the expenditure approach. The third approach, the income approach is used to compile the Income and Outlay Accounts on an annual basis.

Regional dimensions are available both for the production and expenditure accounts through the Gross Regional Domestic Product (GRDP) and the Gross Regional Domestic Expenditure (GRDE), which are likewise compiled on an annual basis.

But recognizing the need for sub-regional accounts in regional planning and development, the NSCB has embarked on the pilot compilation of the Provincial Product Accounts (PPA) in the provinces of Palawan for benchmark years 1988 and 1994 and Guimaras, covering the period 2000-2004. The NSCB has strategized the development of the PPA as a demand-driven activity in partnership with Local Government Units (LGUs). Given the limited financial and manpower resources of the NSCB, priority is being given to interested LGUs who are willing to invest their own resources for the PPA and are committed to support its institutionalization in their respective localities.

4. The production and expenditure accounts are expressed at current and constant prices. The growth rate of GDP is determined from the production side of the accounts as data support on production is stronger and more reliable. Hence, a Statistical Discrepancy is reported as a residual item of the expenditure accounts.

5. The Statistical Discrepancy (SD) is the difference between the GDP level from the production and the expenditure accounts. Statistical Discrepancy occurs as a result of the independent process of compiling the

production and expenditure accounts, the use of different data sources and variations in the quality of data. The combination of survey and other measurement errors likewise contribute to the difference between the estimates. The practice of showing the SD in the PSNA is a way of reflecting transparency in the estimates.

6. The NSCB maintains a link series of the national accounts: the annual series starts from 1946 onwards; the quarterly series from 1981; the GRDP from 1975; and GRDE from 1988. In recent years, however, breaks in the series have not been addressed, primarily due to manpower constraints: (a) the revised annual and quarterly three-year series (2000-2002) released in May 2003 are not linked to the 1946-1999 series with the incorporation of the updated estimates in Construction using data of Government Owned and Controlled Corporations (GOCCs) from the Department of Finance; (b) the revised annual and quarterly three-year series (2003-2005) released in May 2006 are not linked with the series from 2002 backwards with the incorporation of the Business Process Outsourcing (BPO) industry in the Private Services sector while the Miscellaneous Services of the Exports of Non-Factor Services was revised to account for the under coverage of Information Technology (IT)-enabled services/BPOs; the export of Government Services was also revised to account for the expenses on goods and services of embassies and international institutions; and (c) The revised annual series and quarterly three-year series (2004-2006) released last May 2007 are not linked with the series from 2003 backwards due to the following: the updated estimates for the BPO industry; the revision in the Miscellaneous Services of the Exports of Non-Factor Services; updated estimates for Manufacturing using the Quarterly Survey of Business and Industry (QSPBI) to supplement the Monthly Integrated Survey of Selected Industries (MISSI) data beginning 2004; and updated estimates for Construction using more updated data on building permits from the National Statistics Office beginning 2004.

Work on updating the link series will be part of the over-all revision/rebasing program of the PSNA, which is targeted for release in December 2007.

7. The PSNA follows a policy on updating or revising the quarterly and annual national accounts through the NSCB Resolution No. 8-97 "Approving the Policy on Updating the National Accounts" where the updating of the quarterly accounts for each quarterly estimation round is limited only to the immediately preceding quarter, while the rest of the past quarters from three years back may be revised only during the May round of estimates.

The NSCB maintains a "History of Revisions," a database showing the revisions of the accounts. The quarterly publication of the national accounts likewise shows the sources and reasons for revisions made for the immediate preceding quarter estimates.

Methodology:

Expenditure Approach

GDP by expenditure is the sum of the final uses of goods and services in the economy, valued at purchaser's prices. Final uses refer to the final consumption of households and private non-institution serving households (Personal Consumption Expenditure); general government (Government Consumption Expenditure); gross fixed capital formation (GDCF) and for exports (net of exports) to the rest of the world.

Gross Domestic Capital Formation consists of fixed capital formation and Changes in stocks. Fixed capital formation is composed of expenditures on Construction; Durable Equipment; and Breeding stocks, Orchard Development and Afforestation.

Benchmark estimates of Personal Consumption Expenditure (PCE) consider the structure of the latest Family Income and Expenditure Survey (FIES) of the National Statistics Office (NSO), which is conducted every three years. For quarterly estimates, PCE adopts a combination of the commodity flow approach (for food, beverage, tobacco, clothing and footwear, and household furnishings) and extrapolation using output indicators from the corresponding production side of the accounts (for fuel, light and water, household operations, transportation and communication and miscellaneous expenditures). The estimation of PCE starts from the constant prices and are

inflated to current prices using the appropriate indices for each subsector.

GCE is the sum of the estimate for government services on the production side and the government's maintenance and other operating expenses (MOOE). Estimates of quarterly expenditures for the national and local governments and social security are extrapolated using the trend of the Department of Budget and Management (DBM) report of the quarterly cash disbursement for MOOE of the national government. Annual and quarterly benchmarks were estimated once the Commission on Audit (COA) annual financial reports for national and local governments and government-owned and controlled corporations (GOCC) are available.

Investments on Durable Equipment originating from domestic and foreign sources utilize the commodity flow approach for the quarterly estimates. The Foreign Trade Statistics (FTS) and the QSPBI in Manufacturing from the National Statistics Office (NSO), provide the basic data for imported and local durable equipment, respectively.

Investments in Construction is estimated as the sum of the gross value of private and public construction and transfer costs. Public construction includes construction in progress and land improvements of the national and local governments and government corporations. Estimates on Public Construction are extrapolated using the trend of the value of actual cash disbursements from DBM. For private construction, gross value is estimated as the sum of the value of physical accomplishments of residential and non-residential construction based on the data on building permits from the NSO.

Annual estimates of Exports and Imports are built up from quarterly estimates. Merchandise Exports and Imports adopt the direct estimation method based on the tabulation of the NSO Foreign Trade Statistics whose basic data come from the Bureau of Customs. The value of gold demonetized by the Bangko Sentral ng Pilipinas (BSP) is also included under Merchandise Exports. Merchandise exports and imports are valued at Free on Board (FOB) and at Cost, Insurance and Freight (CIF), respectively. Meanwhile, Non-Factor Exports and Imports use the Balance of Payment (BOP) data except for Travel.

The compilation of the Philippine BOP has adopted the Balance of Payment Manual 5 (BPM5) starting CY 2000. However, there are still some items in the BOP that cannot be readily used for national accounting due to the limitations of its source of data. Travel under Import of Non-Factor Services is one item wherein there is a divergence between the BOP and national accounts. Estimate of Travel is based on the trend of tourist receipts/travel tax.

Changes in Stocks are estimated for agriculture, crude and petroleum, general government, government-owned and controlled corporations and establishments. The first four sub-sectors are estimated using direct estimation while Changes in Stocks for establishments use the fixed ratio of inventory to production based on the Census of Establishments for Business and Industry.

Lastly, expenditures on Breeding Stocks, Orchard Development and Afforestation are based on extrapolation using the trend of the composite growths of the value of production of selected crops, livestock, poultry and forestry.

The constant price estimates of GCE, Construction, Changes in Stocks, Export and Import of Services are derived by deflating the current price estimates by their respective appropriate indices. On the other hand, Merchandise Exports, Merchandise Imports and Durable Equipment adopt the quantity revaluation method where the volume of goods (reported in Gross Kilos) are valued at base year's prices.

Income Approach

The third approach of compiling the GDP is the income approach, where the income generated by factor shares, i.e., the Gross Value Added (GVA) from the production accounts is distributed to the institutional sector to which it accrues. This is shown in the Income and Outlay accounts, through the current receipts and disbursements of the four institutional sectors-private corporations, government corporations, general government and households and unincorporated enterprises.

The latest Census of Philippine Business and Industry (CPBI), the annual Surveys of Philippine Business and Industry (ASPBI), government reports on financial institutions and public utilities, administrative data sources, financial statements of private corporations and studies on production costs are some of the primary sources of data for the estimation of the factors of production by institutional sector. The estimates of indirect taxes and subsidies are based on the reports of the Commission On Audit (COA), the Bureau of Internal Revenue (BIR) and the Bureau of Customs (BOC).

Production Approach

GDP by industrial origin (production) is the aggregate of the Gross Value Added (GVA) of all resident producing units in the domestic economy valued at producers' prices. The production side of the accounts consists of three major industries: (1) Agriculture, Fishery and Forestry (AFF); (2) Industry; and (3) Services.

Gross Value Added (GVA) by Industrial Origin or by Economic Activity

The Gross Value Added is estimated for each of the production sectors of the economy, namely: (i) Agriculture, Fishery and Forestry; (ii) Mining and Quarrying; (iii) Manufacturing; (iv) Construction; (v) Electricity and Water; (vi) Transportation, Communication and Storage

(TCS); (vii) Trade; (viii) Finance; (ix) Ownership of Dwelling and Real Estate (ODRE); (x) Private Services; and (xi) Government Services.

The production side of the accounts uses three major approaches in the estimation of the GVA, namely:
a) Direct approach – GVA is derived by deducting the cost of goods and services used up in the process of production (intermediate inputs) from the total value of goods and services (gross output) during the period. This approach is generally used to generate the annual benchmark estimates of the production sectors using data from the latest Censuses and annual Surveys.
b) Indirect approach or the use of GVARs – When the required data is not sufficient to estimate the GVA using the direct approach, as in the case of the quarterly national accounts, the use of Gross Value Added Ratios (GVARs) is adopted. Often referred to as the indirect approach, GVA is simply obtained as the product of the gross output and the GVAR. The GVA for Agriculture, Fishery and Forestry; Mining and Quarrying; and Construction are derived using the Gross Value Added Ratio (GVAR) appropriate to the sector.

Since the quarterly data differs from the annual benchmark data due to limitations in detail and coverage, the quarterly data for AFF, Mining and Construction are adjusted for undercoverage by applying an undercoverage ratio (UCR) relevant to the sector. The respective GVARs and UCRs are computed from the latest Census of Philippine Business and Industry (CPBI), Census of Agriculture and Fishery (CAF) or the Annual Survey of Philippine Business and Industry (ASPBI); and administrative reports from source agencies.

c) Volume/Value Extrapolation – This approach utilizes the use of output indicators to extrapolate the GVA for the quarterly estimates. Government services use the trend of the quarterly cash disbursement of personal services of the national government workers from the Department of Budget and Management (DBM). Government services are benchmarked annually and quarterly based on the Commission on Audit (COA) annual financial reports for the national and local governments and government-owned and controlled corporations (GOCC) with lag time of one year from the reference year. Manufacturing, Electricity and Water, TCS, Trade, Finance, Real Estate and Private Services sectors rely on the trend of revenues from the monthly (Monthly Integrated Survey of Selected Industries (MISSI) (for Manufacturing) and the Quarterly Survey of Philippine Business and Industry (QSPBI) of the National Statistics Office (NSO) supplemented by other indicators to extrapolate the GVA. However, for Ownership of Dwellings (OD) in the ODRE sector, the GVA is based on the trend of stock of residential structures.

The current PSNA still uses the fixed base-year method for constant price estimates with 1985 as the base year. AFF uses the quantity revaluation method while Mining and Quarrying adopts the volume extrapolation method to

derive the constant price estimates. Manufacturing and the Services sectors apply the single deflation method using the appropriate price indices. For Electricity and Water and Private Services, specific composite price indices were developed as deflators to estimate the constant prices.

Poland

Source

The preparation of annual national accounts statistics in Poland is undertaken by the National Accounts and Finance Division, the Central Statistical Office located in Warsaw. The official estimates are published annually on the internet (www.stat.gov.pl), in "National accounts by institutional sectors and sub-sectors" (CSO), as well as in the annual statistical yearbooks: Concise Statistical Yearbook of Poland and Statistical Yearbook of the Republic of Poland. The concepts, definitions, sources and methods of estimation were described in above-mentioned publications.

In December 2006 a complete methodological inventory on GDP compilation was submitted by central Statistical Office to EUROSTAT. This inventory describes in detail all methods applied in compiling the accounts and presents numerical examples.

General

The estimates shown in tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 and European System of Accounts 1995.

Two kinds of revisions of national accounts are conducted: the routine and the cyclic revisions. The routine revisions concern the successive versions of estimation from provisional to final version of national accounts. The routine revisions are regular conducted and are made four times. The cyclic revisions caused by methodological changes, changes in law and other reasons takes place every few years and always comprises full time series- in the case of PNA starting from the data for the year 1995.

In Polish national accounts the constant price calculation is carrying out at previous year prices. For calculation at constant prices the broad range of price data is used.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated from both the production and expenditure sides. The income approach is calculated independently.

Expenditure Approach

Expenditure approach is the one from the main approaches for GDP estimation. Expenditure components of GDP are calculated separately for final consumption expenditure, for gross capital formation, and for exports less imports.

Household final consumption expenditure is estimated according to COICOP classification scheme. HFCE estimates are independent, complete and consistent with the output approach. It is calculated as a bottom up estimate .Household consumption expenditure is recorded at purchasers' prices. The main data sources for compiling HFCE are: retail statistics based on statistical reports, households budget survey, balance of agricultural products, surveys on travel abroad and on border traffic, balance of payments, administrative sources.

For the government final consumption expenditure estimation the data are obtained from budgetary statistics and supplementary sources for units that are not obliged to provide the budgetary reports. For the social security funds the data are derived from budgetary reporting, accounting data of social insurance institutions, Insurance and Pension Funds Yearbook. GFCE is distributed into individual consumption expenditure and collective consumption expenditure.

Gross fixed capital formation data are elaborated by kind of fixed assets, by kind of activity according to NACE, by

institutional sectors as well. All estimates are based on the statistical and budgetary reports. Gross fixed capital formation is valued at purchasers' prices.

The annual data for changes in inventories are based on quarterly estimations. Changes in inventories are estimated at average constant prices of previous year. In order to estimate them at current prices the obtained value of changes in inventories at constant prices in quarterly periods is converted into current prices using quarterly price indices for sale in enterprises' sector (previous year=100). The main data sources are statistical reports.

The main data source for value of exports and imports of goods is the foreign trade statistics compiled by CSO on the basis of custom statistics (data from INTRASTAT and SAD). The value of exports of goods is shown on the FOB basis, while imports of goods – on CIF basis. Data for exports of transport services come from the banking statistics that registers settlements with non-residents and it is increased by the cost of transport rendered by Polish carriers and included in the invoices of trade in goods. For foreign travel data are obtained from Institute of Tourism. Information on other services comes mainly from the statistics provided by banks and from reports received from non-financial corporations involved in trade of services with non-residents. Data sources and methods to calculate the imports of services are the same as in the case of exports.

Every aggregate of expenditure approach is calculated at constant prices using the broad range of price indices. In addition, the data for retail trade and information on quantitative dynamics of purchased goods (food and non-food) and services from Households Budget Survey are used.

Income Approach

For income approach the same data sources are used as in the output approach. Compensation of employees is expressed in gross term: income tax and social contributions payable by employees and employers are included. In general, data sources for calculation are the same as for compilation of gross output and intermediate consumption (statistical reports, budgetary reports supplemented by other sources for units that are not obliged to provide the budgetary reporting, annual report of central bank and reports of commercial banks). Additional adjustments are made for compensation of employees in individual farms, for tips and for hidden economy.

Taxes and subsidies are calculated on accrual basis. Data are derived from administrative sources mainly from budgetary statistics. Gross operating surplus and mixed income do not exist in the bookkeeping system of units in Poland thus gross operating surplus is calculated as a residual item. Mixed income is calculated only for households sector as the difference between gross value added and compensation of employees and other taxes on production.

Production Approach

Production approach is the main approach for estimating GDP. The basic data for compilation of estimates from output approach come from structural business statistics and from other supplementary data sources.

For general government sector data are obtained from budgetary statistics and supplementary sources for units that are not obliged to provide the budgetary reporting. Basic data for compiling the output approach of financial institutions come from the reports on financial results of banks, insurance units and other financial institutions.

Gross output is valued at basic prices. Valuation of gross output is made on the basis of the statistical sources mentioned above. The value of output of the private farms is estimated using the method of direct calculation, i.e. quantity of produced crop and animal products multiplied by their appropriate prices.

Data regarding dwelling stocks is compiled on the basis of the results of general censuses as well as the Population and Housing Census as of 2002 and the balance of dwelling stocks as of 31 December, in each administrative division. Imputed rents are estimated with the User Cost Method according to Commission Decision of 18 July 1995.

Output for private households with employed persons is estimated at the level of compensation of employees. Intermediate consumption is valued at purchasers' prices. These prices include basic prices, transport costs, trade margin and non-deductible taxes on products.

Gross value added is valued at the same prices as gross output – at basic prices. It is calculated as a residual item.
Double deflation is used in output approach. Each element of output approach aggregates is deflated separately using the broad range of price indices.

Portugal

Source

The preparation of national accounts statistics in Portugal is undertaken by the Statistics Portugal (INE), Lisbon. The official estimates are disseminated in the official website, quarterly and annually, under the theme "National Accounts", INE. The present inventory of sources and methods describes the methodology used by the Portuguese System of National Accounts (SNCP) base 2000. The description seeks essentially to explain the processes applied in the base year. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. The data was received through the Organisation for Economic Co-operation and Development (OECD), Paris.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). The National Accounts in Portugal are according to the European System of National Accounts, ESA95, which is an EU regulation meaning that it is mandatory for the EU countries. Some ESA95 transmission tables are regularly transmitted to Eurostat. Presently Statistics Portugal compiles annual full fledged Supply and Uses Tables and Integrated Economic Accounts. Estimates of annual GDP are normally available on a provisional basis 9 months after the reference year, on an A6 level and for the main components of GDP. Also this level of detail is available for quarterly National Accounts and these are disclosed 70 days after the reference quarter. All data since 1995 are available in Euro, the present national currency. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

On 1 January 1999 the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries all data starting 1999 is in euro. - The data before 1999 is still in national currency but it was converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of Portugal the currency name for the data before 1999 is "1999 PTE euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 200.482 Portuguese escudo. - The name of the currency of the newly submitted data is "1999 PTE euro" for the data before 1999 and "euro" for the data from 1999 on. In the database this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for Portugal, like for example all old data following the 1968 SNA is still in "Portuguese escudo", although this is not specifically indicated in the tables.

Methodology:

Overview of GDP Compilation

Gross Domestic Product is estimated mainly through the production approach. One of the principal aims of the Portuguese System of National Accounts is to ensure the highest level of exhaustiveness in the determining GDP given the statistical sources. The final phase of compiling national accounts is bringing everything together, and this relies in particular on comparison of all the data obtained automatically with a view to ensuring their coherence. The theory behind establishing this balance means that the estimation of aggregates is only deemed to be final after compilation and comparison of the Supply/Use Table (SUT) and the Integrated Economic Accounts Table.

Special note should be taken of the balancing of the SUT, since it is in the context of the balance between sources

and uses (supply and demand) for products that the principal decisions are taken influencing the computation of GDP.

Expenditure Approach

The methodology used to compute the variables governing GDP from the expenditure approach was as follows:

Final consumption expenditure of households – the basis for this variable is the Household Budget Survey where the values are extrapolated, encoded by NPCN and adjusted in order to bring them into line with the concepts of national accounts.

Final consumption expenditure of NPISH – this variable results from the transfer of goods and individual non-market services, their value being equal to the value of non-market production.

Final consumption expenditure of general government – this is computed from other non-market production, it is estimated from costs, less payments made by households.

GFCF – GFCF from the expenditure approach is determined from data obtained via institutional sectors (S12, S13 and S15) and in data obtained from the Structural Business Survey (for units of Sector S11 and unincorporated enterprises of S14). For Sectors S12 and S13 the data are exhaustive; for others they are incomplete. This situation results in adjustments based on GFCF obtained from the production approach, through compilation of sources and uses balances. For reasons of exhaustiveness and economic consistency, the prevailing approach is that of supply.

Acquisitions less cessions of valuables (ACOV) – comprises the acquisition of non-financial assets which are neither used in the production process nor consumed, do not under normal conditions deteriorate over time, and are generally acquired and held as a store of value. The value for ACOV is the result of compilation of sources and uses balances, based on identification of codes in the PRODCOM and the foreign trade classification giving rise to ACOV.

Variations in stocks – a preliminary approximation to the value of variations in stocks is made taking data from the Structural Business Survey, and this is then filled out with data from the Annual Industrial Output Survey. Available data allows this flow to be disaggregated into variations in stocks at the producer, in commerce and with the user. A transition is subsequently made from data by activity to data by products.

Exports / Imports – these variables are obtained from statistics of international trade for their goods components, and the balance of payments for services. Since external trade statistics are not exhaustive an estimate is made from foreign trade (Intrastat) data.

Income Approach

The income approach has not played a major role in determining GDP, for lack of suitable statistical sources. These results in the computation of gross operating surplus as a balance from the operating account, with compensation of employees, taxes and subsidies computed independently. For the components of GDP from the income approach computed independently, the following estimation methods were applied:

a) Compensations:– direct estimation from data of the Structural Business survey, Income tax data and exhaustive sector data (S13 and S12);

b) Other taxes and other subsidies on production – direct method, from accounting data provided by the units making up general government.

Production Approach

Production transactions can be estimated by all three types of producer: market producers, non-market producers and producers for own final consumption. Taking the various statistical sources together allows the variables necessary for computation of GVA to be obtained for virtually all products and branches.

The transition from business bookkeeping and administrative data to ESA95, National Accounts concepts through the use of bridge tables, where an exhaustive importance is given of the takeover of data from the Structural Business Survey, the Annual Industrial Output Survey, the Survey of Credit Institutions and Financial Corporations and data from General Government.

One of the important factors affecting exhaustiveness is the estimation of two components which may be ignored in business accounting: benefits in kind and tips and gratuities. The production of each branch includes the adjustments made for each of these components.

The methodology for determining GDP from the production approach varies according to branch:

a) In agriculture, forestry and fisheries, production is computed from the application of prices to quantities produced. The principal sources are Estatísticas Agrícolas, published by the Department of Statistics of Agriculture and Fisheries which compiles, inter alia, the Statistics of Crop Production; Statistics of Animal Production and Forestry Statistics.

b) In the non-market and market branches of general government and NPISH, production is obtained from accounting data of general government bodies, or, for NPISH, fiscal sources. Non-market production is valued by reference to production costs;

c) For the production of market goods and services, data are obtained in particular from the Structural Business Survey, the Annual Industrial Output Survey and data specific to certain products. This survey is the main source for these branches, other than NACE J – Financial intermediation – which because of its nature is the subject of specific surveys which enable the estimation of the transactions necessary to determine GVA.

Values for taxes and subsidies on products are obtained from accounting data provided by the units making up general government.

Puerto Rico

Source

Reply to the United Nations national accounts questionnaire from the Planning Board, San Juan. Official estimates are published periodically by the Board in "Ingreso y Producto-Puerto Rico Income and Product". The following presentation of sources and methods is mainly based on information received from the Planning Board.

General

The estimates provided in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

Methodology:

Overview of GDP Compilation

Gross domestic product is estimated mainly through the expenditure approach.

Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach except private final consumption expenditure of goods and private investment in machinery and equipment which are estimated through the commodity-flow approach. Estimates of government consumption expenditure are based on special tabulations prepared by the accounting division of the Department of the Treasury. For personal consumption expenditure on goods, import data in f.o.b. values are obtained from the trade statistics whereas transport costs by commodity are computed by the Division of Economic Accounts. Estimates of locally produced goods are prepared by using the Puerto Rican censuses of manufactures as benchmarks and extrapolating these data for other years. Estimates of local sales of agricultural products are furnished by the Division of Agricultural Statistics. Adjustments for changes in trade inventories and mark-ups are made on the basis of data obtained from income tax returns and from the firms concerned. For some goods, the estimated quantity consumed is multiplied by the average price believed to have been paid by the consumer.

Estimates of services are based on the gross receipts of the firms or organizations providing the services. Estimates of changes in stocks for the manufacturing sector are obtained through the use of census data which are extrapolated for the non-census years. For sugar and tobacco, quantity data from official sources are multiplied by the average export prices. For trade, inventories are calculated as percentages of sales from a sample of income tax returns. These percentages are then applied to the estimated total sales. Farm inventories of livestock are computed from data supplied by the Department of Agriculture. Estimates of gross fixed domestic investment in construction are obtained directly through surveys among the contractors. For those not covered by the surveys, data from building permits are used. Private investment in machinery and equipment is estimated on the basis of import statistics.

For the government sector, capital expenditure estimates are based on direct surveys within the agencies and on special tabulations prepared by the accounting division of the Department of the Treasury. Sales to the rest of the world, i.e., to the federal government and other non-residents of Puerto Rico, include wages and salaries paid to federal employees and all purchases of goods and services by the federal government. These data are obtained from the records of the agencies themselves. Data on imports are obtained from the trade statistics issued by the United States Department of Commerce. For the constant price estimates, private final consumption expenditure is obtained by multiplying quantities by base year prices where quantity data are available. Otherwise, the current estimates are deflated by appropriate price indexes. For all other components of GDP by expenditure type, price deflation is used.

Income Approach

Basic data on wages and salaries are derived from records of the Bureau of Unemployment Insurance, from censuses of business and manufacturers and from income tax returns and other financial reports of private businesses and public corporations. The method used for estimating operating surplus in manufacturing, construction and some services consists in calculating, from a sample of income tax returns, ratios of profits and other property income to wages and salaries. These ratios are then applied to total wages and salaries. For some industries, the method is based on ratios of profits to gross receipts as reported on the income tax returns. Rental income of persons is estimated by deducting from the total rent paid the rent received by businesses, government and the rest of the world. Depreciation is estimated by applying to the total wages and salaries the ratio of depreciation charges to wages and salaries or to gross receipts, in the case of trade, derived from income tax returns. Data on indirect taxes and subsidies are obtained in detail from government reports.

Production Approach

The table of gross domestic product by kind of economic activity is prepared at market prices, i.e., producers' values. The income approach by distributive shares is used to estimate the value added of each industrial sector. The net income by distributive shares is available by industrial sector. Business transfer payments, depreciation and subsidies are distributed using direct information. Indirect business taxes are obtained from government reports and are broken down by industrial sector, using economic indicators such as data on local production and imports. For the constant price estimates, price deflation is used for the different economic activities of GDP.

Reply to the United Nations national accounts questionnaire from the Central Statistical Organization, Doha.

General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). The previous estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1968 (1968 SNA) as far as the existing data would permit.
